About this document

This document provides feature information for the DMS-100 switch. Feature information is intended to help operating company personnel to prepare for insertion of a new BCS load, or to understand elements of the software. Operating company personnel involved in planning and engineering or in maintenance activities will find this document useful.

When to use this document

Northern Telecom (NT) software releases are referred to as batch change supplements (BCS) and are identified by a number, such as BCS35. This document is written for DMS-100 Family offices that have BCS36 and up. Note that the present version of the *Feature Description Manual* adds to the content of previous versions, but does not replace them. This version of the *Feature Description Manual* contains descriptions of both feature packages and features that were introduced in this BCS as well as those changed in this BCS. DO NOT discard previous versions of the *Feature Description Manual*.

More than one version of this document may exist. The version and issue are indicated throughout the document, for example, 01.01. The first two digits increase by one each time the document content is changed to support new BCS-related developments. For example, the first release of a document is 01.01, and the next release of the document in a subsequent BCS is 02.01. The second two digits increase by one each time a document is revised and rereleased for the same BCS. The *Feature Description Manual* is issued twice in each BCS: a Preliminary issue and a Standard issue. The Standard issue corrects and replaces all information in the Preliminary issue for the same BCS, but it does not replace all of the content of Standard versions from previous BCSs. When you receive the Standard issue of the *Feature Description Manual* for BCS36 and up you should discard the Preliminary issue for BCS36 and up, but do not discard other Standard versions from previous BCSs.

To determine which version of this document applies to the BCS in your office, check the release information in *DMS-100 Family Guide to Northern Telecom Publications*, 297-1001-001.

How to identify the software in your office

The *Office Feature Record (D190)* identifies the current BCS level and the NT feature packages in your switch. You can list a specific feature package or patch on the MAP (maintenance and administration position) terminal by typing

>PATCHER;INFORM LIST identifier

and pressing the Enter key.

where

identifier is the number of the feature package or patch ID

You can identify your current BCS level and print a list of all the feature packages and patches in your switch by performing the following steps. First, direct the terminal response to the desired printer by typing

>SEND printer_id

and pressing the Enter key.

where

printer_id is the number of the printer where you want to print the data

Then, print the desired information by typing

>PATCHER;INFORM LIST;LEAVE

and pressing the Enter key.

Finally, redirect the display back to the terminal by typing

>SEND PREVIOUS

and pressing the Enter key.

How this document is organized

This document consists of descriptions of feature packages and features. Several supporting sections are also included.

Hardware requirements

The section “BCS36 and up hardware requirements” on page 1-1 lists the system hardware required for BCS36 and up. Hardware requirements are also provided in the individual feature descriptions where appropriate.

Summary tables

The “Feature impact summary table” that begins on page 2-1 indicates, for each feature, whether information exists under the following headings: Hardware restrictions, Pack diagnostic specifics, Restrictions and limitations, Feature interactions, Datafill, Service orders, Operational measurements, Logs, User interface, and Automatic message accounting. This table provides an overview of the information available in this document for each feature in the current software release and all those documented in previous versions of the *Feature Description Manual*.

The “Feature-to-NTP summary table” that begins on page 3-1 identifies Northern Telecom publications (NTP) that contain further details on each feature in the current software release. The table also shows which functional areas are affected by that feature, such as maintenance, translations, or administration.

Feature package descriptions

Feature package descriptions are arranged in alphanumeric order according to package number. Numbers precede letters in the alphanumeric order; for example, package NTX901AA comes before NTXA00AB. Each feature package originating in BCS28 or later is briefly described. The BCS in which the package was created is given under the heading “BCS history.” A table entitled “Feature package contents” lists the current contents of the feature package, which may include features added in various BCSs. A table entitled “Required feature packages” lists the feature packages that are required for the package to function.

Each feature package description is followed by a description of each feature added to the package in BCS36 and up. Note that a feature may occur in more than one package. To relate a feature number to its feature package number(s), see the cross-reference tables at the end of this document.

Feature descriptions

Each feature is briefly described. The BCS in which the feature originated is given under the heading “BCS history.” In some cases, this section indicates that a feature originated in a previous BCS has been changed for this BCS.

The following sections are included if they apply to the feature described:

- Hardware requirements
- Pack diagnostic specifics
- Restrictions and limitations
- Feature interactions
- Datafill
- Service orders
- Operational measurements

- Logs
- User interface
- Automatic message accounting

If one of the sections listed above is absent from an individual feature description, the section does not apply to that feature.

Cross-reference tables

The following cross-reference tables are located at the end of the document:

- features listed by BCS
- feature number to feature package and BCS
- feature package to feature number and BCS
- feature name to feature number, package, and BCS

How reference documentation is organized

The *Feature Description Manual* is part of reference documentation that supports the Northern Telecom line of DMS-100 Family products. Reference documentation is a subset of the DMS-100 Family library.

Reference documentation consists of the following documents.

Number	Title
297-XXXX-310	<i>Service Orders Reference Manual</i>
297-XXXX-451	<i>Customer Data Schema</i>
297-1001-119	<i>Automatic Message Accounting-Northern Telecom Format</i>
297-1001-128	<i>Automatic Message Accounting-Bellcore Format</i>
297-1001-455	<i>Office Parameters Reference Manual</i>
297-1001-805	<i>Hardware Description Manual</i>
297-1001-814	<i>Operational Measurements Reference Manual</i>
297-1001-820	<i>Nonmenu Commands Reference Manual</i>
297-1001-821	<i>Menu Commands Reference Manual</i>
297-1001-840	<i>Log Report Manual</i>

BCS36 hardware requirements

BCS-required hardware is defined as the modification necessary to load BCS software into the DMS-100 switch. All equipment introduced in BCS36 is listed in this chapter in table form.

Product line

BCS36 hardware requirements are for the DMS-100 Family product line.

Any office that is upgrading a BCS must meet the minimum hardware requirements. These minimum requirements are based on additions to the previous BCS hardware requirements. All other hardware requirements for BCS36 are related to specific features. Feature-related hardware requirements are described under the heading “Hardware requirements” in each feature description.

Note: For Canadian applications only, one NT6X47AC pair is provisioned on new modules and replaces NT6X47AB on existing modules. The second NT6X47AB is not provisioned for Canadian jobs.

Provisioning information

The following tables list the hardware introduced in BCS36.

BCS36 requirements for line group controller (LGC), line trunk controller (LTC), and digital trunk controller (DTC)	
Module	BCS36
LGC	No change from BCS35
LTC	No change from BCS35
DTC	No change from BCS35
DTC used for CCS7	No change from BCS35

1-2 BCS36 hardware requirements

BCS36 requirements for subscriber carrier module-100 rural (SMR), subscriber carrier module-100S (SMS), and subscriber carrier module-100 urban (SMU)	
Module	BCS36
SMR	No change from BCS35
SMS	No change from BCS35
SMU	No change from BCS35

BCS36 requirements for remote switching center (RSC), dual RSC, and message switch and buffer 7 (MSB7)	
Module	BCS36
RSC	No change from BCS35
Dual RSC	No change from BCS35
MSB7	No change from BCS35

BCS36 requirements for line concentrating module (LCM), remote LCM (RLCM), and outside plant module (OPM)	
Module	BCS36
LCM	No change from BCS35
RLCM (with ESA)	No change from BCS35
OPM (with ESA)	No change from BCS35

BCS36 requirements for SuperNode	
Module	BCS36
Computing module	No change from BCS35
Message switch	No change from BCS35
System load module	No change from BCS35

BCS36 requirements for TOPS multipurpose	
Module	BCS36
TPC shelf	No change from BCS35

BCS36 requirements for ISDN	
Module	BCS36
LGCI/DTCI	No change from BCS35
LCMI	No change from BCS35
RCCI	No change from BCS35

BCS36 requirements for international line group controller (ILGC), international line trunk controller (ILTC), and international digital trunk controller (IDTC)	
Module	BCS36
ILGC	No change from BCS35
ILTC	No change from BCS35
IDTC	No change from BCS35

1-4 BCS36 hardware requirements

The following table lists the minimum packfill levels required for BCS36.

Module	BCS36
LGC	NT6X02LC (new) NT6X02LA NT6X02AT
LTC	NT6X02MC (new) NY6X02MA NT6X02AU
DTC	NT6X02IC (new) NT6X02IA NT6X02AS
DTC (for CCS7)	NT6X02IC (new) NT6X02IA NT6X02AS
SMR	NT6X02CC (new) NT6X02CQ (upgrades)
SMS	NT6X02DH (new) NT6X02DD NT6X02DC
SMU	NT6X02EG (new) NT6X02EB NT6X02AW
RSC remote cluster controller (RCC)	NT6X12AG (new) NT6X12CA NT6X12AD
Dual RSC (RCC)	NT6X12AG (new) NT6X12CA NT6X12AD
MSB7	NT6X32CA NT6X32AB
line concentrating equipment (LCE)	NT6X03RA NT6X03RB NT6X04AA (LCM)
RLCM host interface equipment (HIE)	NT6X11AA
OPM (HIE)	NT6X11AA
SuperNode computing module (CM)	NT9X06AC
message switch (MS)	NT9X04AE
system load module (SLM)	NT9X07AB
-continued-	

Module	BCS36 (continued)
TOPS MP (TPC)	NTNX61AC
ISDN intracalling, ISDN access controller (IAC)	Replace with LGI/LTCI
ISDN LGC/DTC	NT6X02NA
ISDN LCM	NTBX31AC
ISDN RCC	NT6X12DE
Note: New = PECs for an initial office receiving a BCS load. Upgrades = PECs for an existing office that is upgrading a BCS load.	
End	

Summary table

This table provides an overview of the information available for each feature, and how it affects the DMS environment. The table shows all features in the current software release and all those documented in previous versions of the *Feature Description Manual*. The features are listed in the left column in alphanumeric order by feature package, and Ys are placed in the various columns across the page to show what is affected by that feature. For example, a Y in the **L** column indicates that the feature affects Logs, and further details are available in the “Logs” section of the feature description.

Available feature information										
Package feature	HW	PDS	R&L	FI	DF	SO	OM	L	UI	AMA

Feature-to-NTP summary table

This table identifies Northern Telecom publications (NTP) that contain further details on each feature in the current software release. The features are listed in the left column in alphanumeric order by feature package, and Ys are placed in the various columns across the page to show the functional area affected by that feature. For example, feature AR0238 in package NTX042AA has a Y in the Maint column, and further maintenance details are available in the *AIN Release 0.1 SSP Complete Maintenance Guide*, 297-5161-510.

This feature package create a base software load to enable Traffic Operator Position System (TOPS) Automated Directory Assistance Service (ADAS) application processor units (APU) to run on UNIX-based systems.

The feature package provides the following services:

- communication utilities for the various components, interfaces to enable messaging, and support for an application level timer
- support for simultaneous call processing, maintenance and communications interfaces, data updates, and generation of logs and operational measurements
- management of distributed application processes on APUs, and monitoring of these processes by the ADAS APU resource manager
- ADAS call processing
- background processing including service data updates
- utilities to encode or decode voice processing unit and computing module messages

This feature package applies to DMS-100 offices.

This feature package was created in BCS36.

NTG320AA

Required feature packages

Required feature packages	
Feature package number	Description
NTG321AA	OA&M Position
NTG322AA	Voice Processing Unit
NTXQ23AA	TOPS ADAS (for BCS35 release)

Feature name

ADAS Communications Interface

Description

This is one of a group of features that sets up an environment for call processing applications running on UNIX-based systems. This feature provides a set of communication utilities that perform the following functions:

- establish and maintain communication between the call processing engine (CPE) and other components, such as the computing modules (CM), voice processing units (VPU), and the application processor unit with UNIX (APUX) process management agent
- provide interface capabilities to allow the CPE to receive messages from the CM, the APUX process management agent and multiple VPUs
- provide interface capabilities to allow the CPE to send messages to the CM, the APUX process management agent and multiple VPUs
- provide interface capabilities to support an application level timer

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of two cards: NTEX22BA (integrated processor and F-bus interface card) and NT9X14DB (24-Mbyte memory card). These cards together make up the APUX, and occupy two slots of a link peripheral processor (LPP) cabinet.

Restrictions and limitations

The timer provided by this feature is insufficient for applications that have time-extensive VPU commands.

Feature interactions

In order to function properly, this feature interacts with the following new and existing features:

- AF2801 MMI Enhancements to Bilingual AABS
- AF3050 CPE Internals
- AF3290 Logs and Alarms Transfer - UNIX-SOS
- AF3291 APUX Process Management Agent
- AF3381 ADAS APUX Call Processing Applications
- AF3384 ADAS CM/Voice Utilities
- AF3385 ADAS CM/VPU Simulator
- AJ0317 IWS Interprocess Communications (IPC)

- AJ1209 IPC Enhancements to Support Message Queues
- AL1982 MTS Messaging Access for UNIX Applications on SNIX Nodes

Logs

This feature creates one new log, UCOM001. The log is generated when a communication connection is lost, or cannot be established.

Feature name

ADAS CPE Internals

Description

This is one of a set of features that together create a call processing engine (CPE). This feature provides a framework that allows a CPE to manage the processing of a number of calls simultaneously. The framework also provides a maintenance interface, communications interfaces, and support for dynamic data updates, as well as generating the required logs and operational measurements.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of two cards: NTEX22BA (integrated processor and F-bus interface card) and NT9X14DB (24-Mbyte memory card). These cards together make up the APUX, and occupy two slots of a link peripheral processor (LPP) cabinet.

Restrictions and limitations

The maximum number of calls which can be handled by a CPE is dependent upon real-time and memory constraints. A CPE with a simple subscriber operator interaction can handle more calls than a CPE with a high message volume and numerous call actions to perform.

Feature interactions

This feature provides call management facilities for the following features:

- AF3048 ADAS Communications Interface
- AF3049 ADAS APUX Resource Manager
- AF3381 APUX Call Processing Application

AF3291

Feature name

APUX Process Management

Description

This feature starts, stops, and monitors distributed UNIX application processes on the application processor units (APU) in a voice processing platform (CVPP). It also allows computing module (CM)-resident Automated Directory Assistance Service (ADAS) APU resource manager (AARM) to monitor the health of these processes. By changing the datafill, this feature can be used to manage any kind of UNIX application process on an APU.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of two cards: NTEX22BA (integrated processor and F-bus interface card) and NT9X14DB (24-Mbyte memory card). These cards together make up the APUX, and occupy two slots of a link peripheral processor (LPP) cabinet.

Restrictions and limitations

The service description file cannot be updated by operating company personnel.

Feature interactions

In order to function properly, this feature interacts with the following new and existing features:

- AF3049 ADAS APU Resource Management
- AF3379 File System Access to SLM/SLMII/IOC
- AF3381 ADAS APUX Call Processing Applications
- AF3382 ADAS Data Manager
- AJ0317 UAE Interprocess Communication
- AJ0326 UAE OAM Data Collector
- AL1982 MTS Messaging Access for UNIX Applications on SNIX Nodes
- AN0047 Enhanced Services Resource Manager
- AN0162 ADAS UNIX Loadbuild and Software Installation

Datafill

Since ADAS is presently the only UNIX-based application process that runs on an APU, the only valid entry in the appropriate field of table SNIXAPPL is ADAS.

Logs

The following three logs are created as a part of this feature:

- UAPM300 An unrecoverable application error has occurred
- UAPM301 A critical process has failed
- UAPM302 A non-critical managed process has failed

AF3381

Feature name

ADAS APUX Call Processing Application

Description

This feature forms part of a set of features that together provide Automated Directory Assistance Service (ADAS). This feature provides a call processing application that runs on an application processor unit (APU) in the UNIX environment. The application interacts with the computing module (CM) and the voice processing unit (VPU) to provide automated interaction with the caller during the initial phase of a directory assistance call.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of two cards: NTEX22BA (integrated processor and F-bus interface card) and NT9X14DB (24-Mbyte memory card). These cards together make up the APUX, and occupy two slots of a link peripheral processor (LPP) cabinet.

Restrictions and limitations

This feature provides 40 call processing channels for each APU.

Operational measurements

This feature creates a new operational measurements (OM) group, with the group name ADASAPU. This group contains 14 registers, and records various call processing statistics for the ADAS application running on the APU.

Logs

This feature creates seven new logs. The logs, and the conditions under which they are generated, are as follows:

- UADA300 The ADAS call processing application received a message that appeared to be invalid
- UADA301 The call timer has expired
- UADA302 The ADAS application was unable to register with the local OM collector
- UADA303 The ADAS application failed in an attempt to send a message to the CM or VPU
- UADA304 The APU has detected an error in the APU/VPU protocol
- UADA305 The APU has detected a critical fault on the VPU
- UADA306 A command in a message to the VPU has failed

User interface

This feature, in conjunction with the CM and VPU, provides the automated greeting and requests for information that are presented to callers when they initially access the ADAS. In addition, it controls the transfer of the callers' responses to the operator.

AF3382

Feature name

ADAS Data Manager

Description

This feature provides a background process running on an application processor unit (APU). The process receives updated service data from the operation, administration and maintenance (OAM) position Automated Directory Assistance Service (ADAS) Data Manager, by way of the computing module (CM), and applies it to the next arriving call. Calls in progress when the updated data is received are not affected.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of two cards: NTEX22BB (integrated processor and F-bus interface card) and NT9X14DB (24-Mbyte memory card). These cards together make up the APU, and occupy two slots of a link peripheral processor (LPP) cabinet. One data manager resides in each ADAS APU.

Feature interactions

In order to function properly, this feature interacts with the following new and existing features:

- AF3049 ADAS APUX Resource Management
- AF3050 ADAS CPE Internals
- AF3291 APUX Process Management
- AF3381 ADAS APUX Process Management
- AJ0326 UAE OAM Data Collector
- AN0056 ADAS Service Data MMI

Logs

This feature creates 15 new logs. The logs, and the conditions under which they are generated, are as follows:

- UCDM301 Current calls are accessing old and new service data
- UCDM302 Service data shared memory is created by the data manager and is required by the call processing engine (CPE) for operation
- UCDM303 Data manager is unable to extract a message from the message transport system (MTS) buffer
- UCDM304 A message is corrupted in transit from the ADAS-APUX resource manager (AARM) to the data manager

- UCDM305 The data manager has received a message type known to the AARM, but not to the data manager
- UCDM306 A new service data update is received by the data manager while it is still processing a previous update
- UCDM307 Data manager has received a service data update notification with incorrect data, or no data
- UCDM308 Data manager is unable to detach from the service data shared memory when the data manager is going down
- UCDM309 Data manager is going down
- UCDM310 Service data is missing from the MTS message sent by the AARM. Service data is not updated on a specific APU
- UCDM311 Data manager is unable to define the message transport address (MTA) on an APU
- UCDM312 Data manager is unable to initialize the interprocess communication (IPC) on a specific APU
- UCDM313 Data manager is unable to register with the MTS
- UCDM314 Data manager is unable to register with the APUX process manager (APM)
- UCDM315 Data manager is unable to send out an MTS message when responding to the AARM

AF3384

Feature name

ADAS Voice/CM Utilities

Description

This feature forms part of a group of features that collectively support the provision of the Automated Directory Assistance Service (ADAS). This feature provides a library of routines for encoding and decoding voice processing unit (VPU) and computing module (CM) messages. VPU messages are sent between a call processing engine (CPE) and a VPU. CM messages are sent between a CPE and a CM.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of two cards: NTEX22BB (integrated processor and F-bus interface card) and NT9X14DB (24-Mbyte memory card). These cards together make up the application processor unit (APU), and occupy two slots of a link peripheral processor (LPP) cabinet.

Feature interactions

This feature interacts with the following features to provide the required functions:

- AF3050 CPE Call Manager
- AF3194 ADAS TOPS CC APU Protocol
- AF3381 ADAS APUX Call Processing Application
- AN0031 VPU Service Circuit Protocol

This feature package enables operating company personnel to set up and modify Automated Directory Assistance Service (ADAS) prompts, set timeouts, responses, and operator interface.

It also provides a tool to convert audio files to conform to the ADAS service data interface.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTG321AA contents	
Feature number	Description
AN0056	ADAS Service Data MMI
AN0182	BDS to VREC Conversion Tool

BCS history

This feature package was created in BCS36.

AN0056

Feature name

ADAS Service Data MMI

Description

The ADAS Service Data MMI (SDM) feature is provided to allow service personnel to set up and modify the Automated Directory Assistance Service (ADAS). It provides a window into the service that permits personnel to change prompts, set timeouts, define responses to a caller's input signals, or customize the operator interface. SDM also allows new information to be uploaded to the service. Scenarios can be saved locally on the workstation for later retrieval.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature is installed on the operations, administration, maintenance, and provisioning (OAM&P) workstation. This is an HP 9000-series workstation, running UN*X and UAE base software. A local area network (LAN) connection is required to allow the workstation to communicate with the computing module (CM) over an Ethernet link.

Restrictions and limitations

ADAS SDM software assumes that there is only one OAM&P workstation for the service.

Once an upload command has been entered, the upload process must be allowed to complete before another upload is attempted. The SDM disables the upload command input while an upload is in progress.

Feature interactions

This feature uses feature AN0178 (ADAS MMI Data File Transfer) to move the updated service data from the workstation to the appropriate places in the ADAS system. The feature also notifies the system of the update and informs the SDM of the progress of the upload.

This feature also uses feature AN0182 (VDS to VREC Conversion Tool) to convert Vocabulary Development System (VDS) messages into a format suitable for downloading into the voice processing unit (VPU).

User interface

Service personnel can customize the caller/ADAS and ADAS/operator interaction by changing service data. This data includes the following parts of the interaction scenario:

- prompt information
- recording timeouts
- caller input masks
- playback parameters

Service personnel can reconfigure ADAS to the specific requirements of the operating company using a graphical interface at the workstation. From the same workstation, the information is then uploaded into the ADAS system.

AN0182

Feature name

VDS to VREC Conversion Tool

Description

This feature provides a tool to convert an audio file produced by the Vocabulary Development System (VDS) into the appropriate format for use by the Automated Directory Assistance Service (ADAS) service data manager (SDM).

BCS history

This feature was created in BCS36.

Hardware requirements

This feature is installed on the operations, administration, maintenance, and provisioning (OAM&P) workstation. This is an HP 9000-series workstation, running UN*X and UAE base software. A local area network (LAN) connection is required to allow the workstation to communicate with the computing module (CM) over an ethernet link.

Restrictions and limitations

Recorded audio files must be in Computer Consoles Inc. VDS format.

Once a digital audio reference tag (DART) is assigned, it is never reissued. The first reference number applied is 32767, and subsequent messages are numbered in decreasing order. The maximum number of messages that can be created is, therefore, 32 767.

The integrity of the data stored on the OAM&P workstation is assumed. The integrity of the custom_dartlist file, which tracks the allocation of DARTs to custom audio messages, is required in order to maintain the valid allocation of DARTs to custom messages.

The category definitions are dependent upon implementation of the SDM. Any changes in SDM require appropriate updates to the category definitions.

Feature interactions

This feature requires the file structure provided by feature AN0056 (ADAS Service Data MMI) to store audio information in the SDM.

User interface

This feature requires the user to input the following information:

- VDS audio file names
- purpose of each message
- context for each message
- category selections for each message
- a unique name for each message

NTG322AA

Voice Processing Unit

This feature package provides the required software for voice processing, including the following functions:

- maintenance tasks associated with the voice processing unit (VPU)
- service circuit processing
- messaging interface and protocol, message routing and flow control
- diagnostic support for the recording-announcement processor (RAP) and channel-bus interface (CBI)
- speech memory downloading and management utilities for local resource management
- detection and verification of dual-tone multifrequency signals
- recording inputs from callers and playback of prompts and recordings
- coordination of the record, play and diagnostic functions

This feature package applies to DMS-100 offices.

Feature package contents

Required feature packages	
Feature package number	Description
NTXS31AA	Enhanced Service Resource Management

AF3005

Feature name

VPU Local Maintenance

Description

This is one of a group of features that together provide a flexible voice processing package (VPP). This feature creates the software to carry out maintenance tasks associated with the voice processing unit (VPU).

BCS history

This feature was created in BCS36.

Hardware requirements

The software created by this feature resides on the VPU. The VPU occupies two adjacent slots on a link peripheral processor (LPP) shelf.

The following three cards make up the VPU:

- NTEX22BB Integrated processor and F-bus interface card
- NTMX97AA Recording-announcement processor card
- NTMX99AA C-bus interface, 512 channel paddle board

Restrictions and limitations

There is no partial functionality for the VPU. If any part fails, the whole VPU reverts to the system busy state.

Feature interactions

This feature interacts with the following features on the VPU:

- AF3007 VPU Service Circuit Processing
- AF3031 VPU RAP/CBI Low Level Interface
- AF3033 VPU RAP Diagnostic Support
- AF3035 VPU Local Resource Management
- AF3392 RAP Firmware
- AF3432 VPU MAP and Table Control

Feature name

VPU Service Circuit Processing

Description

This feature provides service circuit processing software for the voice processing unit (VPU). This software allows the VPU to implement the service circuit interface protocol and associated processing. These are used to drive the service circuits.

BCS history

This feature was created in BCS36.

Hardware requirements

The software created by this feature resides on the VPU. The VPU occupies two adjacent slots on a link peripheral processor (LPP) shelf.

The following three cards make up the VPU:

- NTEX22BB Integrated processor and F-bus interface card
- NTMX97AA Recording-announcement processor card
- NTMX99AA C-bus interface, 512 channel paddle board

Restrictions and limitations

The service circuit processing software is activated only while the VPU is in service.

The network interface unit (NIU) must be in service before the VPU is returned to service.

Feature interactions

This feature interacts with the following features on the VPU:

- AF3005 VPU Local Maintenance
- AF3031 VPU RAP/CBI Low Level Interface
- AF3033 VPU RAP Diagnostic Support
- AF3035 VPU Local Resource Management
- AF3392 RAP Firmware
- AF3432 VPU MAP and Table Control

AF3031

Feature name

VPU RAP and CBI Low Level I/O

Description

This is one of a group of features that together provide a flexible voice processing package (VPP). This feature provides the messaging interface and protocol between the integrated processor and F-bus interface (IPF) software and the speech processing software running on the four digital signal processor cells (DSPC) residing on the recording-announcement processor (RAP). It also provides driver software for a channel bus interface with 512 channels (CBI-512). This driver software controls and monitors network channel access by the RAP.

BCS history

This feature was created in BCS36.

Hardware requirements

The software created by this feature resides on the IPF processor part of the VPU. The VPU occupies two adjacent slots on a link peripheral processor (LPP) shelf.

The following three cards make up the VPU:

- NTEX22BA Integrated processor and F-bus interface card
- NTMX97AA Recording-announcement processor card
- NTMX99AA C-bus interface, 512-channel paddle board

Restrictions and limitations

The software created by this feature should only be run on the IPF within the VPU hardware.

The maximum allowed message length is 1024 bytes.

Feature interactions

This feature interacts with the following features to provide the VPP:

- AF3005 VPU Local Maintenance
- AF3007 VPU Service Circuit Processing
- AF3033 VPU RAP Diagnostic Support
- AF3035 VPU Local Resource Management
- AF3392 RAP Firmware
- AN0046 RAP Application and Diagnostics

Feature name

VPU RAP and CBI Diagnostic Support

Description

This feature resides in the integrated processor and F-bus interface (IPF) and provides diagnostic support for the recording-announcement processor (RAP) and the channel bus interface - 512 channel (CBI-512). It also invokes the digital signal processing cell (DSPC) diagnostic software through the IPF-DSPC message interface for RAP onboard diagnostics.

BCS history

This feature was created in BCS36.

Hardware requirements

The software created by this feature resides on the IPF part of the VPU. The VPU occupies two adjacent slots on a link peripheral processor (LPP) shelf.

The following three cards make up the VPU:

- NTEX22BA Integrated processor and F-bus interface card
- NTMX97AA Recording-announcement processor card
- NTMX99AA C-bus interface, 512 channel paddle board

Restrictions and limitations

The software created by this feature should only be run on the IPF within the VPU hardware.

Basic out-of-service diagnostics depend upon the DSPC ROM software. The DSPC RAM software must be downloaded for the extended out-of-service and in-service diagnostics.

DSPC RAM software should be downloaded after basic out-of-service diagnostics are completed. The speech audio load should be loaded after extended out-of-service diagnostics are completed.

If the network interface unit (NIU) is not enabled, the PCM loopback and miscellaneous interrupt tests should be omitted.

Feature interactions

This feature interacts with the following features to provide the VPP:

- AF3005 VPU Local Maintenance
- AF3031 VPU RAP and CBI Low Level I/O
- AF3035 VPU Local Resource Management
- AF3392 RAP Firmware
- AN0046 RAP Application and Diagnostics

AF3035

Feature name

VPU Local Resource Management

Description

This is one of a group of features that together provide the voice processing package (VPP). This feature provides local resource management for the voice processing unit (VPU). This includes speech memory downloading and management utilities and resource management facilities.

BCS history

This feature was created in BCS36.

Hardware requirements

The software created by this feature resides on the VPU. The VPU occupies two adjacent slots on a link peripheral processor (LPP) shelf.

The following three cards make up the VPU:

- NTEX22BB Integrated processor and F-bus interface card
- NTMX97AA Recording-announcement processor card
- NTMX99AA C-bus interface, 512 channel paddle board

Restrictions and limitations

The VPU supports a maximum of 512 digital audio reference tags (DART). 256 DARTs are reserved for prerecorded prompts, announcements, and tones; the remaining 256 are for caller inputs.

The VPU has provision for 34.45 minutes of audio. This is the maximum and, because speech memory (SMEM) is assigned in blocks, the actual amount of speech time that can be stored is somewhat less than this. For planning purposes a practical maximum of 30 minutes should be assumed.

Feature interactions

This feature interacts directly with the following features:

- AF3005 VPU Local Maintenance
- AF3007 VPU Service Circuit Processing

Feature name

RAP DTMF Support

Description

This feature provides the low-level signal processing operations required for the detection and verification of dual-tone multifrequency (DTMF) digit signals received at the recording-announcement processor (RAP). The feature also includes the interrupt handler for the pulse code modulation (PCM) interface part of the RAP.

BCS history

This feature was created in BCS36.

Hardware requirements

The software created by this feature resides on the RAP part of the voice processing unit (VPU). The VPU occupies two adjacent slots on a link peripheral processor (LPP) shelf.

The following three cards make up the VPU:

- NTEX22BA Integrated processor and F-bus interface card
- NTMX97AA Recording-announcement processor card
- NTMX99AA C-bus interface, 512 channel paddle board

Restrictions and limitations

The software contained in this feature is designed specifically to operate within an environment defined as the digital signal processing cell (DSPC). The DSPC is a processing resource located on the RAP.

Resolution of all timeout conditions (such as a jammed DTMF key) is restricted to multiples of 28-ms units by the DTMF detection algorithm.

DTMF digits must meet the specifications defined in Bellcore technical reference TR-TSY-000181, *DTMF Receiver Generic Requirements for End-to-end Signaling over Tandem-switched Voice Links*.

Feature interactions

This feature interacts with the following features to provide the full RAP software package:

- AN0016 RAP Play and Record Processing
- AN0046 RAP Application and Diagnostics

AN0016

Feature name

RAP Play and Record Processing

Description

This feature provides the recording-announcement processor (RAP) with the ability to record input from a caller, and to play back announcements and recorded speech.

BCS history

This feature was created in BCS36.

Hardware requirements

The software created by this feature resides on the RAP part of the voice processing unit (VPU). The VPU occupies two adjacent slots on a link peripheral processor (LPP) shelf.

The following three cards make up the VPU:

- NTEX22BA Integrated processor and F-bus interface card
- NTMX97AA Recording-announcement processor card
- NTMX99AA C-bus interface, 512 channel paddle board

Restrictions and limitations

The software contained in this feature is designed specifically to operate within an environment defined as the digital signal processing cell (DSPC). The DSPC is a processing resource located on the RAP.

Resolution of all timeout conditions (such as a jammed DTMF key) is restricted to multiples of 28-ms units.

Feature interactions

This feature interacts with the following features to provide the full RAP software package:

- AF3394 RAP DTMF Support
- AN0046 RAP Application and Diagnostics

Feature name

RAP Application State Machine

Description

This feature provides the recording-announcement processor (RAP) state machine that coordinates the record, play, and diagnostic functions. The feature also includes diagnostics.

BCS history

This feature was created in BCS36.

Hardware requirements

The software created by this feature resides on the RAP part of the voice processing unit (VPU). The VPU occupies two adjacent slots on a link peripheral processor (LPP) shelf.

The following three cards make up the VPU:

- NTEX22BB Integrated processor and F-bus interface card
- NTMX97AA Recording-announcement processor card
- NTMX99AA C-bus interface, 512 channel paddle board

Restrictions and limitations

Due to realtime constraints, the number of active channels is limited to 5 for the interactive mode and 20 for the non-interactive mode.

Only one diagnostic test at a time may be run on a digital signal processor cell (DSPC).

Feature interactions

This feature interacts with the following features to provide the VPU:

- AF3005 VPU Local Maintenance
- AF3007 VPU Service Circuit Processing
- AF3031 VPU RAP/CBI Low Level Interface
- AF3033 VPU RAP Diagnostic Support
- AF3392 RAP Firmware
- AF3394 RAP DTMF Support
- AN0016 RAP Play and Record

NTX001AA

Common Basic

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTX001AA contents	
Feature number	Description
AC0285	Dialed Loopbacks on Trunks
AC0308	Fixed Trunk Group Numbering-SMDR
AD2997	Trunk Group Expansion to 8K
AF0149	DIRP CI Robustness
AF0209	Device Independent Support for Application Data Transmission
AF0916	Enhanced AMA Dump Capability
AF1237	Conference Circuit (3/6 Port) Diagnostic Enhancements
AF1452	Memory Administration-New OM
AF1461	DIRP Recording Space Usage Enhancements
AF1749	Real-time Input OM
AF1780	DIRP Space Rotation
AF2013	Office Routes Capacity Increase
AF2470	Special Application Patching
AF2531	Forced Sequence Application
AF2532	Obsolete Packaging
AF2705	DIRP DDP Reload and Swact Recovery
AF2815	Patcher Integration
AF2816	Auto-apply Enhancements
AF4281	Auto-Apply for all ISN Nodes
AF4283	Patchset Simplification
AF4286	ISDV File Format Prep
AF5766	Parm E1 Outage Robustness Plan
AG0239	Format OM DIRP Output
AG0274	CC Support for DTU Busy, RTS and Test
AG0275	CC Support for DTU Downloading
-continued-	

Feature package NTX001AA contents (continued)	
Feature number	Description
AG0329	Real-time Study of Current DMSNOS I/F for LBR (Part I)
AG0336	Image Test Enhancements
AG0355	OM Output Robustness
AG0361	High Water Mark OMs for CP, EXT, FTRQ
AG0568	Fixed Trunk Group Numbering for the OM System
AG0637	LMD OM Group Optimizations
AG0695	Trapinfo Enhancement
AG0696	Dynamic PC Reconfiguration
AG0724	ParmCalc-Verify Office Parameters (Phase 2)
AG0821	ParmCalc-Verification of Office Params
AG0855	XPM Outgoing Message Flow Control
AG0919	Decouple CC Hardware and Software System Initialization I
AG1006	Scheduled XPM Patch Application
AG1007	Scheduled CC/CM Patch Application/Image
AG1262	O/G Message Flow Control-Follow-up
AG1296	MTC Base Performance Tools
AG1818	CP Long Messaging Implementation I
AG1824	Matching Line Drawer Status over CC Warm SwAct
AG1868	Provide CC Warm SwAct Residency in All Loads
AG1869	CC Warm SwAct Man Machine Interface Enhancements
AG1922	Improve Memory Parity Detection
AG1924	NT40 Mismatch Handler Refinements
AG1925	NT40 CMC RTS Improvements (Diagnostics)
AG1927	BCSMON-Enhanced Monitoring Capabilities
AG2108	One Night Process Enhancements
AG2149	Core SwAct Restart Outage Reduction-Phase I
AG2150	Core SwAct Exec Optimization-Phase I
AG2255	CC Warm SwAct Module Check Program
AG2276	CC Warm SwAct Restart Outage Reduction-Phase II
-continued-	

Feature package NTX001AA contents (continued)	
Feature number	Description
AG2277	CC Warm SwAct MMI Enhancements-Phase II
AG2323	Logical Reformatting for OTC
AJ0191	H/W-S/W Initialization Coordination-II
AJ0192	RCC/LCM Loading Enhancements I
AJ0194	CC Warm SwAct Enhancements
AJ0474	XPM P-side Data Distribution Enhancements
AJ0729	Trunks RTS Enhancements II
AJ1957	Table Integrity Checker
AJ1959	Table Version System
AJ2240	Removing Requirement of Reformats for Hidden Fields
AJ2290	BCS Update Enhancements
AL0044	Outage Footprint-Phase II
AL0045	Match Command Improvement
AL0046	Outage Footprint Facility
AL0047	Babbling Idiot Enhancements
AL0049	Enhanced LCM Overload Controls
AL0131	PM Autoloading-Phase II
AL0152	Close Logs to SCCS after Restarts
AL0195	ECCB Improvements
AL0205	OMPRT Output Buffering
AL0479	Trunk RTS Enhancements
AL0480	PM Map Enhancements
AL0481	XPM IPML Data Distribution
AL0482	XPM P-side Data Distribution
AL0914	Remote File System Improvements
AL0972	HX Immunity Regions for CI Processes
AL1052	Lost Messages-Reporting Enhancements
AL1149	User Passwords Survivability over BCS Application
AL1518	User Programmable LTP Levels
-continued-	

NTX001AA

Feature package NTX001AA contents (continued)	
Feature number	Description
AL2417	Convert Series I PMs to Recovery Controller
AL2486	TPS Application Resource Usage Control
AL2667	MICBASE Robustness and Performance Enhancements
AL2669	Restart Performance Enhancements
AN0100	CMR Enhancements for ADSI
AQ0841	DMS-Bus Message Flow Control III
AQ0878	Call Clean Up Robustness
AQ0967	CC Support for Compact Conference Peripheral (CCP) (Part 1)
BC0046	T101 Agency Rework to Comtrunk
BC0047	T103 Agency Rework to TTLSUPV
BC0049	TTL2 Agency Rework to TTLMWBL
BC0050	T1 Maintenance Level
BC0083	Polling AMA Data-via Datapac-Manual
BC0084	System Monitor Display
BC0113	Polling AMA Data-via Datapac-Manual
BC0124	Interface to Co-located NE/AE Switchboard O/G
BC0125	Interface to Co-located NE/AE Switchboard I/C
BC0127	Interface to Co-located NE/AE Switchboard I/C
BC0156	2-Way (Local) EAS Trunk
BC0248	Identification of Intercept-Output ANI Digit 9
BC0316	Allow Changes to Office Configuration Table
BC0325	Digital Recorded Announcement
BC0385	TSMS Peg Count Source and Disposition up to 16
BC0386	TSMS Peg Count Source and Disposition up to 16
BC0387	TSMS Peg Count Source and Disposition up to 16
BC0388	TSMS Peg Count Source and Disposition up to 16
BC0390	TSMS Peg Count Source and Disposition up to 16
BC0391	TSMS Peg Count Source and Disposition up to 16
-continued-	

Feature package NTX001AA contents (continued)	
Feature number	Description
BC0392	TSMS Peg Count Source and Disposition up to 16
BC0393	Traf SEP Destination Data
BC0398	TSMS Peg Count Source and Disposition up to 16
BC0401	TSMS Peg Count Source and Disposition up to 16
BC0458	(NSG) Route List Chaining
BC0485	NPE-Rework of PM MAP Displays
BC0506	OM Call Processing Restart Pegs (XRef 0382)
BC0628	MTCE Updates for CR TM
BC0637	Robustify TM MTCE
BC0667	Priority MAP Terminal
BC0668	MAP Software Enhancement
BC0672	Enhanced Real Time Indicator
BC0724	Alarming on DMS/RLM Links
BC0806	PM Autoloading-Phase I
BC0820	New Outgoing Idle Supervision for Trunks
BC0821	Trunk Signal Timing Changes
BC0937	OM Tape-Suppression of Zero Data
BC0938	OM Print-Suppression of Zero Data
BC0942	(NSG) Fast Routine to Get Time of Day in Clock
BC0980	Support for EEPROM Cards in DRA
BC0981	Loop Monitor Elimination on 2X83
BC0982	CONF6PR as 2 CONF3PR
BC0985	AMA Real-time Enhancements (AT&T Format)
BC0991	Terminating NPA in AMA Records
BC1017	Machine-independent SOS-Phase 1
BC1036	Default Data
BC1051	Minor POF Enhancement
BC1052	Licensee Foldback
BC1064	Modify TM Tone Diagnostics for NT2X59BA
-continued-	

Feature package NTX001AA contents (continued)	
Feature number	Description
BC1075	Carrier Enhancements
BC1078	Variable Timing-Analogue DP Trunk Reception & Outpulsing
BC1090	Provide Optionality Hooks on DCMS
BC1108	Call Timing Office Parameter Cleanup
BC1163	LM Takeover/Takeback Diagnostic
BC1219	System Speedup
BC1241	OM-Outside Plant Measurements-Phase I
BC1273	Enhanced Priority Terminal
BC1295	DTMF Outpulsing on DTCS Without Senders
BC1357	Retention Test of Allocated Memory
BC1384	Enhanced DIRP File Cleanup
BC1392	MAP Support Tools
BC1403	Improved AMA Timing Compensation
BC1422	PM to Facility Maintenance Improvements
BC1433	PM Maintenance Enhancements
BC1490	CLLI Enhancements-BCSA APPL Speedup
BC1501	Peripheral Status Check Report before SwAct
BC1517	Call Processing Robustness
BC1717	AMA Preservation over Peripheral Warm SwAct
BC1729	Enable Gain on CLSI Network
BC1735	OM Xfer Speedup
BC1925	Query Command Enhancements
BC2015	Robustification of LM/RLM Maintenance
BC2016	Carrier Maintenance on MTCMAIN
BC2246	No-Call-Processing Alarm
BC2312	Log System Internal Control Cleanup
BC2330	Trunk Supervision over DTC SwAct-Preparatory
BF0170	DTC-DP Digit Reception/Outpulsing
-continued-	

Feature package NTX001AA contents (continued)	
Feature number	Description
BF0201	DTC Revertive Pulsing Firmware
BF0210	Revertive Pulsing Facility Maintenance
BF0218	LTC-Speech Path Diagnostic
BF0227	DTC MF Outpulsing Primitives
BF0285	LTC-BCS CC Application Support (C0863, C0864)
BF0363	LTC SwAct-Uncontrolled
BF0364	LTC-SwAct Peripheral Enhancement
BF0366	LGC 500/2500 CP
BF0369	LGC 500/2500 Enhanced CP
BF0374	LGC Backward BCS Compatibility
BF0380	102 Test Line Termination Level (See H0271)
BF0383	DS-1 Card Maintenance Enhancement
BF0389	LGC MP RT Improvements-Phase 2
BF0487	LTC Digit Collection Enhancement
BF0505	MPC ROM Maintenance and CC Loader
BF0568	CC Boot Loader Firmware Enhancement
BF0611	XPM Overload Control-1
BF0612	XPM Real-time Enhancements-BCS16
BF0642	1X67 Terminal Controller Improvements
BF0792	RLM SP Store Saving
BF0938	Trunk RTS Speed-up-Phase I
BF0939	Trunk RTS Speed-up-Phase II
BF0957	LCM Drawer Maintenance
BR0005	ONI to North Electric TSD
BR0010	Interface to Stromberg-Carlson Turret for ONI
BR0045	Outgoing Trunk to 3CL Switchboard (2X85)
BR0046	Incoming Trunk from 3CL Switchboard (2X86)
BR0061	AE LTD Interface
BR0066	Identification of Alarms-Outpulse ANI Digit 8
-continued-	

NTX001AA

Feature package NTX001AA contents (continued)	
Feature number	Description
BR0070	Automatic Intercept Service (Outpulsed Called Number)
BR0084	7- or 10-digit Toll Calls without Prefix 1
BR0085	Remote Make Busy for 2X86
BR0092	115 Repair Service Regenerated to 7 Digits
BR0097	1200-Baud Dial-up Data Set
BR0113	Interface to SC XY for ANI/CAMA
BR0120	VDU & Printer Link Terminal Capability
BR0124	I/F to S-C TSC SCAMA ...ONI/ANIF...
BR0125	I/F to S-C ONI Turret Visual Indicators
BR0126	Dial-up Service Analysis
BR0135	Trunk I/F to AE No. 31 Switchboard
BR0141	Polling for OM Data (UDC Interface)
BR0146	Interface to Co-located NE/AE Switchboard O/G
BR0147	Interface to Co-located NE/AE Switchboard I/C
BR0162	MAP Support for BT100 Terminals
BR0165	Input Command Screening-I/O Port Restrictions
BR0202	Map Support for Cybernex Terminal
BR0221	Trunk Data Base Queries
BR0265	Digital Carrier Module for Small Remotes (DCM-RR)
BR0303	Digital Recorded Announcement
BR0314	Hard-coded OM Names
BR0365	Office ID in TTY Output Header Label
BR0377	Trunk 00S for Data Change
BR0394	Revertive Calls-Selective Announcements
BR0449	1+ Permissive and Non-permissive Dialing
BR0457	Bermuda Special Service Codes
BR0536	Critical Message Prioritization
BR0566	Bell (U.S.) Standard Announcements via PROM
BR0588	Automatic Busy-out of Trunks upon Integrity Check Failure

-continued-

BCS history

This feature package was created in BCS00.

BCS35-AF4282, AF4283, AF4286, AF5766, AJ2240, AJ2290, AL2486, AL2667, AL2669, AQ0878, AQ0967 and AR0225 added

Required feature packages

Required feature packages	
Feature package number	Description
NTX000AA	Bilge

AF4281

Feature name

Auto-Apply for all ISN Nodes

Description

The main purpose of this feature is to add Autopatcher capabilities to all Intelligent Service Nodes (ISNs). This feature introduces a new option in which Autopatcher can select a Nodeset for which to process its patch actions.

BCS history

This feature was created in BCS35.

Feature interactions

This feature cannot be released without feature AF4283 (Patchset Simplification).

Datafill

Table	Description
PATNS	New table
PATCTRL	New field
PATSET	New field

The table PATNS is added. Table PATNS is a table of default nodesets that may be used by Autopatcher for patching nodesets or autosets.

The field NSNAME is added to table PATCTRL. The user updates this field with the name of the desired nodeset. Each patch in table PATCTRL has its own Nodeset Option.

The field AUTOSET is added to table PATSET. This is a BOOLEAN (y/n) field, which determines whether the UTOSET option is turned on 'Y' or turned off 'N'.

Feature name

Patchset Simplification

Description

This feature does the following:

- Reduces the program storage used to manipulate patchsets
- Decreases the amount of data storage allocated for patchsets
- Facilitates the patchset implementation concept
- Unifies duplicate patchset routines

BCS history

This feature was created in BCS35.

Feature interactions

BCS35 features AF4281 and AF4286 were released in association with this patchset simplification feature. The unification of procedures and changes made to the patchset types impact feature AF4281.

NTX001AA

AF4286

Feature name

ISDV File Format Prep

Description

This feature is used to lay the groundwork for the Incremental Software Delivery Vehicle (ISDV) file format changes. This activity makes changes in the “patch” file format. The capability of adding new records in the patch file is part of the migration requirements from the existing patch platform to the ISDV platform.

This feature is introduced in BCS35 on NT40, SuperNode and BRISC-based products.

BCS history

This feature was created in BCS35..

Feature interactions

This feature is released in conjunction with other ISDV program features AF4281 (Auto-Apply for ISN) and AF4283 (Patchset Simplification).

Feature name

Parm E1 Outage Robustness Plan

Description

This feature has been created as a means of recording changes in restart requirements that have been made to a number of office parameters and to a data schema table. This is part of a strategy to reduce, and ultimately eliminate, outages caused by the restart requirements that exist for many office parameters and tables when their values are changed. The actual changes to the table and office parameters were made under other feature numbers, or as a result of problem resolutions.

BCS history

This feature was created in BCS36.

Datafill

The following office parameters have been discontinued:

- NUMOUTBUFFS% (NT40 only)
- OOC_CALLS_WAITING_Q_SIZE
- OOC_NUM_STUDY_REG
- OOC_NUM_TRAFFIC_OFFICES
- GATEWAY_CDR_RECORD_ID

For the following office parameters the code has been amended to remove the instruction to effect a restart:

- MAX_BRA_LINES
- MAX_IBN_LINES
- MAX_DATA_LINES
- EOPS_PREFIX_SNPA_FOR_7_DIGIT
- MCCS_VERIFY_TYPE
- SPANISH_OUTGOING_RINGING_TIMEOUT
- MAX_ROUTE_QUEUED_PER_TRKGRP
- TFAN_ENHANCED_FEATURE
- MAX_SUBSCRIBERS_IN_VLR
- MTX_HO_RETRY_TIMER
- NATIONAL_COUNTRY_CODE
- VALIDATE_ACCT_AT_DMS250

For the following office parameter, the maximum value is now inserted at loadbuild:

- PPMBUFFS

Restart requirements have been removed from the following office parameters:

- MTCBASE_EXTRAMSG
- DB_MAX_SIZE
- SO_DID
- TERM_DIGIT_ALLOW
- RESET_DIGIT_ALLOW
- SO_RCF
- NUM_REGISTERED_ROAMERS
- NO_TFAN_OM_REGISTERS
- NO_OCCTS_OM_REGISTERS
- MTCBASE_SCPD
- CONSOLO_SILO_RECORDS
- CONSOLO_SILO_CHARS
- DNPIC_MAX_NUM_DN_TUPLES

Restart requirements for the following office parameter have been removed when the value is increased:

- US_CUG_ENABLED

Restart requirements have been removed from the following table:

- DATASIZE, tuple TONES

Feature name

Removing Requirement of Reformats for Hidden Fields

Description

This feature makes it unnecessary for designers to handle table reformatting for tables with CUSTFLDS/CUSTAREA entries as special cases in order for MOVEBCS to restore the tables successfully.

BCS history

This feature was created in BCS35.

Feature interactions

This feature interacts directly with the MOVEBCS process and with the utilities associated with data transfer: RESTAB, RFMT TAB, JFDUMP, and JFDUMPF.

Implementation of this feature results in the following changes:

- RESTAB will no longer use the information from CUSTFLDS/CUSTAREA when processing a tuple. Instead, the data dictionary's logical tuple definition for the table being tested will be used. Because of this, any fields of a tuple that were reordered by CUSTFLDS/CUSTAREA must be supplied in the correct logical tuple order, and any hidden fields must have data supplied for them in the RESTAB file.
- A table's read and write aspects are now required to read and write valid data for its hidden fields.
- Because the LOGICAL DATAMOVE does not use the information in CUSTFLDS/CUSTAREA, only the EXTERNAL DATAMOVE is affected by this feature. All tuples will be dumped and restored using the default type definitions in the data dictionary rather than CUSTFLDS/CUSTAREA. This will result in the transfer of information from hidden fields.
- The RFMT TAB utility no longer uses CUSTFLDS/CUSTAREA when dumping a table's tuple. There is no apparent change to the applicator because this utility is used in conjunction with RESTAB.
- The JFDUMP utility no longer uses CUSTFLDS/CUSTAREA when processing journal files created in BCS35 and above. There is no apparent change to the applicator because this utility is used in conjunction with RESTAB. Investigation will be required to determine if any journal file records contain invalid data for hidden fields. These cases will be corrected.

AJ2290

Feature name

BCS Update Enhancements

Description

This feature provides enhancements to the BCSUPDATE driver. It also adds internal enhancements to the application process.

BCS history

This feature was created in BCS35.

User interface

- Two commands have been added to the BCSUPDATE level: ABORT_PRESWACT and LIMITED_PRESWACT. These commands will not require additional parameters.
- Two new steps, MATE_RESTART_WARM and MATE_RESTART_COLD, were added to PRESWACT.
- Step STEM_DATE_XFR was deleted from PRESWACT.
- Step MATE_RESTART has been renamed to MATE_RESTART_RELOAD. If users are logged on to the inactive side, this step will stop executing and will prompt the operator to confirm continuation. If the operator chooses to continue, the restart will be performed. If the operator chooses not to continue, the step will fail and PRESWACT will be aborted.
- The RESET command in the BCSUPDATE level is now a privileged command and all usage of the command will be recorded.
- POSTSWACT steps can now be executed by the RUNSTEP command in the BCSUPDATE level.
- The STATUS command has been changed to display the status of the LIMITED_PRESWACT command's steps if LIMITED_PRESWACT has been previously run.
- The HELP BCSUPDATE command has been changed to include help information about ABORT_PRESWACT and LIMITED_PRESWACT. It also includes information about the change to the STATUS command.

Feature name

TPS Application Resource Usage Control Enhancement

Description

This feature provides resource usage control for the Transaction Processing System (TPS) on a per application instance basis. The activity will allow users to specify upper limits on their consumption of the following TPS resources: message buffers, TPS timers and invoker real-time. This will provide the required fire wall protection mechanism and fault isolation among instances of the same TPS application and consequently increase the system's survivability.

PCL history

This feature was created in BCS35.

Logs

The TPS 100 log has been modified so that it has a new possible trouble indicator.

AL2667

Feature name

MTCBASE Robustness and Performance Enhancements

Description

The purpose of this feature is to implement Maintenance Base (MTCBASE) enhancements to the MTCBASE debugging tool. The feature also updates internal design documents.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The feature is targeted to SuperNode DMS switches only.

Feature interactions

This feature allows XPM to have more parallel maintenance actions and consequently faster DMS recovery actions.

Logs

Implementation of this feature results in deletion of logs MTCB105 and MTCB108.

The log MTCB108 has been modified so that the following fields were added:

- UserType, which indicates which application has been affected when the extramsmsg buffer is not available.
- Reason text, which indicates the exact reason why the extramsmsg buffer is not available.

Feature name

Restart Performance Enhancements

Description

This feature reduces core restart times by removing the wait performed by the Message Switch (MS) central initialization process. This feature enables the MS to come up during a restart before allowing other modules in the system to initialize. This activity shortens the duration of restart reloads in SuperNode offices by about 20 seconds.

This feature causes the results from feature AQ8826 and the System Recovery Controller Dependency Manager to reduce core restart times.

BCS history

This feature was created in BCS35.

Restrictions and limitations

This feature impacts SuperNode offices only only.

AQ0878

Feature name

Call Cleanup Robustness

Description

The purpose of this feature is to reexamine and rationalize the output of log information in the event of a call death. This activity will organize the information so as to increase the chances of having related logs appear together. Prior to this activity, there was a greater chance of logs being output at different times because different processes generated them.

BCS history

This feature was created in BCS35.

Logs

The log AUDT103 was formerly output on every call death. This log was modified so that the case in which a call commits suicide (call_error) will no longer generate such a log. The "REASON" field was formerly used for the call_error reason as well as the trap number. CP Obits are no longer generated on call_errors (suicides).

AQ0967

Feature name

CC Support for Compact Conference Peripheral (CCP) (Part 1)

Description

This feature introduces the new CCP (NT1X81), which contains the equivalent of one Maintenance Trunk Module (MTM) controller and five existing 6-port Conference Circuits (NT3X67). The CCP is a single circuit pack with a direct DS-30 link to the network.

This is a preparatory feature that introduces the hardware independent portions of the software in BCS35. The full functionality of this feature will be implemented in BCS36, together with the introduction of the hardware. The BCS36 feature will be AQ0968.

BCS history

This feature was created in BCS35.

Hardware requirements

The following Product Engineering Codes were introduced into the DMS software:

- NT1X81AA (domestic: u-Law PCM)
- NT1X81BA (international: A-Law PCM)

Restrictions and limitations

No maintenance functions, such as BSY, RTS, TST, or LoadPM are provided in this feature. They will be implemented in BCS36 feature AQ0968.

Datafill

Table	Description
TMINV	New fields
CONF6PR	Modified
CONF3PR	Modified

The following four fields were added to table TMINV: SINGLE_CARD_TM_SELECTOR, LOC_TM_TYPE, LOC_TM_NUMBER, and LOC_SLOT_NUMBER. The SINGLE_CARD_TM_SELECTOR field determines whether the next three fields will be displayed to the user. The LOC_TM_TYPE field contains the type of shelf where the Conference Trunk Module (CTM) is currently residing. The LOC_TM_NUMBER field contains the external PM number of the shelf where the CTM is currently residing. The

NTX001AA

AQ0967

LOC_SLOT_NUMBER field contains the card position or slot number within the shelf where the CTM in question resides.

The CTM and its associated PEC were added to tables CONF6PR and CONF3PR as valid entries.

User interface

The circuit locate command in the TRK level and the query PM command in the PM level were modified.

Feature name

AINSSP-Basic Trunk Trigger Processing

Description

AR0225 restructures basic trunk call processing software into the Advanced Intelligent Network (AIN), Release 0.1 “Basic Call Models.” This feature also implements the AIN trigger detection points (TDP) applicable to trunk type agents. AIN is a service-control architecture that is engaged during basic call processing when a certain event occurs or a pre-specified condition is met.

BCS history

This feature was created in BCS35.

Restrictions and limitations

This feature supports the following trunk facilities: IBNT1, IBNT2, IT, T1, and T2.

All domestic ISDN user part (ISUP) trunk facilities are supported along with multifrequency (MF), dual-tone multifrequency (DTMF), and dial-pulse (DP) signaling type trunks associated with the trunk types listed above.

Feature interactions

This feature uses the following features:

- AR0219 AINSSP Base: Trigger Tables
- AR0222 AINSSP Base: FPE Based Trigger Processors (Orig/Term)
- AR0223 AINSSP: AIN Line Call Processing to Support Orig/Term Trigger
- AR0224 AINSSP Base: FPE to Support into Collect/Analyzed Triggers
- AR0226 AINSSP: Message Encoder/Decoder I

NTX022AB

NTX801AA	Toll Features I
NTXE65AA	MPC X.25 Interface

AJ2446

Feature name

LDR: MNA Base

Description

This feature is part of a set of features that together enhance the dynamically controlled routing (DCR) within the DMS system. This enhancement permits the DMS switch to handle multiple network access (MNA), allowing a single DMS node to be part of both the local network and the toll network.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The network name must be no more than 12 characters long. The abbreviated network name must be no more than four characters long.

Feature interactions

The existing DCR software is enhanced to handle local dynamic routing (LDR) and MNA.

Operational measurements

This feature changes the software so that the network name is the key to access the peg count registers for the DCRMISC operational measurements (OM) group.

The key to the DCRDEST and DCRLINK OM groups is changed from the destination node name to NETNAME\$DEST_NODE_NAME.

In order to display the peg counts of the OM group registers using the OMSHOW command, both the network name and the node name must be entered with the special \$ character.

Logs

This feature adds the DCR network name field to the following logs:

- DCR100
- DCR101
- DCR102
- DCR103
- DCR104

User interface

This feature modifies the syntax of DCRMOCH MAPCI command in the network management. MAPCI level is modified and DCRSEL command is added in the level as command 11.

AJ2446

Feature name

LDR: MNA Base

Description

This feature is part of a set of features that together enhance the dynamically controlled routing (DCR) within the DMS system. This enhancement permits the DMS switch to handle multiple network access (MNA), allowing a single DMS node to be part of both the local network and the toll network.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The network name must be no more than 12 characters long. The abbreviated network name must be no more than four characters long.

Feature interactions

The existing DCR software is enhanced to handle local dynamic routing (LDR) and MNA.

Operational measurements

This feature changes the software so that the network name is the key to access the peg count registers for the DCRMISC operational measurements (OM) group.

The key to the DCRDEST and DCRLINK OM groups is changed from the destination node name to NETNAME\$DEST_NODE_NAME.

In order to display the peg counts of the OM group registers using the OMSHOW command, both the network name and the node name must be entered with the special \$ character.

Logs

This feature adds the DCR network name field to the following logs:

- DCR100
- DCR101
- DCR102
- DCR103
- DCR104

User interface

This feature modifies the syntax of DCRMUCH MAPCI command in the network management. MAPCI level is modified and DCRSEL command is added in the level as command 11.

Feature name

DCR: MNA Table Control

Description

This feature modifies table control as part of a group of changes that collectively implement the multiple network access (MNA) capability.

BCS history

This feature was created in BCS36.

Restrictions and limitations

A dynamically controlled routing (DCR) trunk group must belong to one network only.

Feature interactions

This feature builds upon the base provided by feature AJ2446 (LDR: MNA Base). It also interacts with the following two features to implement MNA capability:

- AJ2885 DCR: MNA Activation
- AJ2886 DCR: Base RO Modifications

Datafill

Table	Description
DCRNETID	New table, containing network name, short network name, network type, and operation mode status for each network
DESTKEY	Field NETLIST added to record the networks to which the destination belongs
DESTNODE	Field NETNAME added
DCROPT	This table no longer contains tuples. The information is now contained in table DCRNETID
TKTONODE	Field NETNAME added
OFRT	Field added for DCR network name
RTREF	Field added for DCR network name

This feature also removes control of the size of table DESTNODE from field SIZE in table SYSDATA.

AJ2886

Feature name

DCR: Base RO Modifications

Description

This feature makes changes to the remote operation (RO) communications messaging between the DMS switch and the network processor (NP). It is part of a group of changes that collectively implement the multiple network access (MNA) capability. It extends the dynamically controlled routing (DCR) services to include both the local and the toll networks.

BCS history

This feature was created in BCS36.

Feature interactions

This feature builds upon the base provided by feature AJ2446 (LDR: MNA Base). It also interacts with the following two features to implement MNA capability:

- AJ2610 NP MNA Preparation
- AJ2884 DCR: MNA Table Control

Logs

Log DCR 105 has six new reasons added to cover the extra invalid arguments that can be generated.

Log DCR 107 has one additional value added to field DCRINFO to allow identification of inconsistencies in the MNA mode values.

This feature package contains features that modify linkset management. It also allows for national and international variations of point codes.

This feature package applies to DMS-100 SuperNode and DMS-STP offices.

AL2334

Feature name

SRC Controlled Restart and No-Restart SWACT for CCS7

Description

This feature allows the system recovery controller (SRC) to control the recovery of Common Channel Signaling 7 (CCS7) links, linksets, routesets, and pools during warm, cold, and reload restarts, or during a no-restart switch of activity (SWACT).

BCS history

This feature was created in BCS36.

Restrictions and limitations

The no-restart SWACT for CCS7 offices is a function of office size, and certain configurations may not meet the target maximum of 30 seconds for complete switch recovery. Partial call processing will be available within the 30-s limit.

This feature does not support the CCS7 part of service control point I (SCPI) nodes.

This feature does not support the CCITT-based versions of signal connection control part (SCCP).

Feature interactions

This feature is one of four features that function together to allow CCS7, link peripheral processors (LPP), and ISDN user part (ISUP) to use the SRC for core restart recovery. The other features are as follows:

- AI0704 SRC Restart and No-Restart SWACT Support for SCCP and DDM
- AI0705 SRC Restart and No-Restart SWACT Support for LIMs and LIUs
- AR0467 SRC Restart and No-Restart SWACT Support for ISUP

AR0238

Feature name

AINSSP: AIN AMA

Description

Feature AR0238 provides Bellcore automatic message accounting (AMA) format (BAF) recording for Advanced Intelligent Network (AIN) release 0.1, as defined in Bellcore Technical Advisory, *Advanced Intelligent Network 0.1 Switching Systems Generic Requirements* (TA-NWT-001284, issue 1).

A service switching point (SSP) is a switch that can recognize a call that requires AIN processing by an off-board processor, such as a service control point (SCP), without making assumptions about the service being provided. The SSP produces BAF records for AIN calls as specified by the off-board processor and switch-based translations. The response message sent from the off-board processor may contain optional parameters that are used by the SSP billing function.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Message Detail Recording (MDR) module 105 is not provided by this feature.

AIN billing and universal billing are mutually exclusive. Universal billing takes precedence.

Some switch-based features cause a module to be appended to the AMA record that is generated for a call during which the feature is active. With such a module appended, it is not possible to generate a corresponding AIN AMA record for any feature that is not supported for AIN.

Feature interactions

This feature interacts with existing switch-based billing features as follows:

- When a call triggers for the first time, any currently open AMA billing record is discarded. The off-board processor is responsible for sending AMA parameters to restart the billing record. Failure to do this results in loss of the switch-based AMA record for that call. If the call retranslates and becomes a billable call, then a switch-based record is started.

- When either the 3/6/10 Public Office Dial Plan (PODP) trigger or the terminating attempt trigger is met, then a new call leg is established. Any billing (switch-based or AIN) is closed and a new record is started, provided the off-board processor response indicates this. The internal registers that monitor the number of AMA parameters received are reset to initial values.
- Calls that produce terminating billing records will continue to produce these records, along with any AIN billing that occurs on the call.
- The Conference Trunk Usage and Call Forwarding AMA records continue to be produced in addition to the AIN record or switch-based record for interactions with Three-Way Calling and Call Forwarding.
- All AMA pretranslation information is discarded unless the call retranslates following an AIN query.
- If a Centrex line or trunk originates a call that requires a Station MDR (SMDR) call record based on the originating line or trunk group data or IBN translation datafill, the SMDR record will be generated whether or not the call is an AIN call. The SMDR call record generated is a result of the dialed digits. Any retranslation that results directly from an AIN response does not produce an additional SMDR record.

Datafill

Table	Description
AMAOPTS	Option UNANS_AIN added
BCCODES	Tuple AIN added

Operational measurements

Three new operational measurement (OM) registers are provided for tracking AIN AMA errors:

- AMAMAX is incremented whenever the maximum parameter count per AMA record is exceeded.
- AMASLPID is incremented whenever any AMA parameters arrive at the SSP before an AMASlpID parameter.
- AMACONV is incremented whenever any AMA parameters are received in a conversation package.

Automatic message accounting

This feature implements the following functionality:

- AIN Call Completion Structure Code 0220
- AIN Call Termination Structure Code 0221
- Translation Settable Module Code 030
- Service Logic Program Identification Module 039

NTX042AA

AD4733

Feature name

DWS 1203 AMA Billing

Description

Feature AD4733 provides Bellcore AMA format (BAF) recording for dialable wideband service (DWS), as defined in Bellcore technical reference, *Generic Requirements for the Switched DS-1/Switched Fractional DS-1 Service Capability from an ISDN Interface* (TR-NWT-001203, Issue 2, December, 1992).

The feature provides BAF recording for intranetwork, originating access, or terminating circuit-switched calls that have an information transfer rate of 128 kbit/s or greater.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the enhanced network (ENET) and an NTAX78AA card (time switch).

Restrictions and limitations

The Canadian network has not yet established local access and transport areas (LATA) or interexchange carriers (IEC). DWS calls in Canada will, therefore, use only call type code 148, associated with structure code 0190.

Outgoing wideband calls on ATC trunks use call type code 149 instead of call type code 110.

Incoming wideband calls on ATC trunks use call type code 150 instead of call type code 119.

Feature interactions

This feature interacts with the following features:

- AD3936 LEC Wideband Call Processing
- AD4433 LEC WSS ISUP to PRI Interworking
- AD4449 LEC WSS PRI
- AD4732 LEC DWS FGD ISUP

Datafill

Table	Description
AMAOPTS	Field OCCTERM is set to YES to initiate LAMA recording.
CRSFMT	Tuple AMA has value BCFMT added.
OFCENG	Parameter UNIVERSAL_AMA_BILLING is set to OFF to suppress universal AMA.
OFCOPT	Parameter LAMA_OFFICE is set to YES to initiate LAMA recording.

Automatic message accounting

In providing this feature, the following newly defined call types are used:

- Code 148, associated with structure code 0190
- Code 149, associated with structure code 0645
- Code 150, associated with structure code 0645

This feature also adds DWS information transfer rate indicator (ITR) to the existing ITR in structure codes 0190 and 0645.

AN0319

Feature name

Base Automatic Message Accounting (AMA) Re-engineering II

Description

This feature provides an improved method of determining the elapsed time of a call for billing purposes. This is achieved by using the more reliable central control (CC) timing instead of peripheral timing.

With CC timing the answer timestamp and the disconnect timestamp are determined by the CC. When the call disconnects, the answer timestamp is subtracted from the disconnect timestamp to determine the elapsed time of the call.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature forces all calls to use CC timing in the following billing formats:

- Bellcore AMA (Local/Toll/TOPS)
- Northern Telecom (NT) AMA (Local/Toll/TOPS)
- Station Message Detail Recording (SMDR)
- DMS-100 United Kingdom Call Detail Recording (DMS-100 UK CDR)
- Variable CDR (VCDR)

Feature name

DWS 1203 AMA Billing

Description

Feature AD4733 provides Bellcore AMA format (BAF) recording for dialable wideband service (DWS), as defined in Bellcore technical reference, *Generic Requirements for the Switched DS-1/Switched Fractional DS-1 Service Capability from an ISDN Interface* (TR-NWT-001203, Issue 2, December, 1992).

The feature provides BAF recording for intranetwork, originating access, or terminating circuit-switched calls that have an information transfer rate of 128 kbit/s or greater.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the enhanced network (ENET) and an NTAX78AA card (time switch).

Restrictions and limitations

The Canadian network has not yet established local access and transport areas (LATA) or interexchange carriers (IEC). DWS calls in Canada will, therefore, use only call type code 148, associated with structure code 0190.

Outgoing wideband calls on ATC trunks use call type code 149 instead of call type code 110.

Incoming wideband calls on ATC trunks use call type code 150 instead of call type code 119.

Feature interactions

This feature interacts with the following features:

- AD3936 LEC Wideband Call Processing
- AD4433 LEC WSS ISUP to PRI Interworking
- AD4449 LEC WSS PRI
- AD4732 LEC DWS FGD ISUP

Datafill

Table	Description
AMAOPTS	Field OCCTERM is set to YES to initiate LAMA recording.
CRSFMT	Tuple AMA has value BCFMT added.
OFCENG	Parameter UNIVERSAL_AMA_BILLING is set to OFF to suppress universal AMA.
OFCOPT	Parameter LAMA_OFFICE is set to YES to initiate LAMA recording.

Automatic message accounting

In providing this feature, the following newly defined call types are used:

- Code 148, associated with structure code 0190
- Code 149, associated with structure code 0645
- Code 150, associated with structure code 0645

This feature also adds DWS information transfer rate indicator (ITR) to the existing ITR in structure codes 0190 and 0645.

Feature name

Base Automatic Message Accounting (AMA) Re-Engineering II

Description

This feature provides an improved method of determining the elapsed time of a call for billing purposes. This is achieved by using the more reliable central control (CC) timing instead of peripheral timing.

With CC timing the answer timestamp and the disconnect timestamp are determined by the CC. When the call disconnects, the answer timestamp is subtracted from the disconnect timestamp to determine the elapsed time of the call.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature forces all calls to use CC timing in the following billing formats:

- Bellcore AMA (Local/Toll/TOPS)
- Northern Telecom (NT) AMA (Local/Toll/TOPS)
- Station Message Detail Recording (SMDR)
- DMS-100 United Kingdom Call Detail Recording (DMS-100 UK CDR)
- Variable CDR (VCDR)

Feature name

Carrier Identification Code for E800/PVN

Description

Prior to the introduction of this feature the carrier identification code (CIC) was a three-digit code. This limited the number of CICs to a theoretical maximum of 1 000. For the enhanced 800 (E800) and Private Virtual Network (PVN) database services, this feature provides the equal access end office (EAEO) service switching point (SSP) and the access tandem (AT) SSP with the ability to request and accept four-digit CICs from the switching control point (SCP). This raises the theoretical maximum number of CICs to 10,000.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature does not change table TOPECAR to support a four-digit CIC. Under certain conditions E800 calls completing to the inter-LATA (local access and transport area) carrier (IC) use table TOPECAR, field CARDIG, to look up the CIC. If the SCP returns a four-digit CIC and the CIC is not datafilled in table OCCINFO, the leading digit, if zero, is stripped off and the lookup is performed in table TOPECAR. If the leading digit is not zero, the call is routed to treatment.

Similarly, this feature does not change table CLSVSCRC to support a four-digit CIC. Under certain conditions, E800 calls originating at an AT SSP over TOPS trunk groups using feature group C (FGC) signaling use tables TOPECAR and CLSVSCRC to determine the call completion route. If the SCP returns a four-digit CIC, the leading digit is stripped off and the resulting three-digit CIC is used in tables TOPECAR and CLSVSCRC

Feature interactions

This feature builds on features NC0335 (FGD Carrier Identification Code Expansion) and NC0428 (FGD CIC Expansion-PH2) by completing the changes to allow an EAEO or AT to accept four-digit CICs.

Datavill

Table	Description
NSCDEFS	New option 4DGTIC added
STDPRTCT. STDPRT	Field MAXDIGSR maximum value changed from 18 to 25

Office parameter SSP_NSC_CARRIER_ID is changed to accept a four-digit service code.

Logs

Logs DFIL 110 and DFIL 111 are changed to output a four-digit CIC in the log text.

User interface

The output from command TESTSS at the SCCPLOC level of the MAP is changed to print either a three-digit or a four-digit CIC. The output is based upon the size of the CIC received in the response package from the SCP.

Automatic message accounting

This feature changes existing billing records produced for E800 and PVN to include the four-digit CIC returned from the SCP. The IC/INC prefix field of the E800 141 AMA billing and the PVN 021 carrier access module code are redefined to include a four-digit CIC.

NTX270AA

New Peripheral Maintenance Package

This feature package applies to DMS-100 office switches equipped with the new messaging extended multiprocessor system (XMS)-based peripheral module (XPM). Depending on the hardware configuration of a particular switch, various processor combinations can be supported, including the master processor (MP), signaling processor (SP), file processor (FP), ISDN signaling processor (ISP), and unified processor (UP).

NTX001AA	Common Basic

Feature name

XPM Diagnostic History

Description

AF5006 captures diagnostics results that indicate the health of the extended multiprocessor system (XMS)-based peripheral module (XPM). Diagnostic failure counts and card fault counts are stored for each XPM unit. The data is used by feature AF5007 (XPM Pre-SWACT/Post-SWACT Audit) to help determine whether an XPM SWACT is advisable. The data is also available through MAP commands to aid in maintenance activities and outage analysis.

BCS history

This feature was created in BCS35.

Restrictions and limitations

The diagnostic history is supported on the following XPMs:

- line trunk controller (LTC) and LTC with unified processor (UP) (LTC+)
- line group controller (LGC) and LGC with UP (LGC+)
- digital trunk controller (DTC) and DTC with UP (DTC+)
- ISDN DTC (DTCI)
- remote cluster controller (RCC), RCC2, RCC with UP (RCC+), and ISDN RCC with UP (RCCI+)
- subscriber carrier module-100 access
- subscriber carrier module-100 rural (SMR)
- subscriber carrier module-100S (SMS)
- subscriber carrier module-100 urban (SMU)
- subscriber carrier module-100S remote (SMS-R)

On NT40 switches, only the diagnostics (and associated cards) required by feature AF5007 are recorded.

Feature interactions

This feature can stand alone, but it is needed by feature AF5007 (XPM Pre-SWACT/Post-SWACT Audit).

Logs

Log PM601 is generated whenever the long-term failure (LTF) counters for a particular PM are manually reset. A summary of the counters previous to reset are listed in the log to ensure that no data is lost.

User interface

A new option is added to command DISP at the PM level of the MAP terminal. This option displays the diagnostic history data (as shown below) for all XPMs in the office or for all XPMs of a given PM type.

```
Disp <Option> {state<state>{SysB, ManB, Offl, CBSy, ISTb, InSv},  
              DiagHist}  
              [pmtyp]
```

Command QUERYPM, at the directory of a posted PM, is enhanced to display the diagnostic history data (shown below).

```
QUERYPM [<option> {Flt,  
                  Cntrs,  
                  DiagHist [<diag> {DIAG},  
                             <card> {CARD),  
                             <reset> {RESET}}}]
```

Option DIAGHIST is added to command QUERYPM to allow the following actions:

- The default action displays the failed diagnostics and associated cards.
- Option DIAG displays the summary of diagnostic failures counts.
- Option CARD displays the summary of the cards reported as hardware failures.
- Option RESET resets the LTF counters to zero and displays log PM601 with a summary of the counters prior to the reset.

Feature name

XPM Pre-SWACT/Post-SWACT Audit

Description

AF5007 enhances the existing audit that occurs before a switch of activity (SWACT), creates a centralized SWACT controller, creates a post-SWACT audit, and implements a SWACT back capability. The overall purpose of this feature is to reduce extended multiprocessor system (XMS)-based peripheral module (XPM) outages by preventing a SWACT (whether initiated manually or by the system) if the inactive unit is deemed unreliable. AF5007 also checks to see if the newly active unit can communicate with the central control (CC) after a SWACT, and performs a SWACT back to the previously active unit if the newly active unit cannot communicate.

BCS history

This feature was created in BCS35.

BCS36 Changed

Restrictions and limitations

The warm SWACT enhancements are supported on the following XPMs:

- line trunk controller (LTC) and LTC with unified processor (UP) (LTC+), without an ISDN signaling preprocessor (ISP)
- line group controller (LGC) and LGC with UP (LGC+), without an ISP
- digital trunk controller (DTC), DTC with UP (DTC+), without an ISP
- CCS7 digital trunk controller (DTC7)
- remote cluster controller (RCC) and RCC with UP (RCC+)
- ISDN RCC (RCCI+)
- subscriber carrier module-100 rural (SMR)
- subscriber carrier module-100S (SMS)
- subscriber carrier module-100 urban (SMU), without an ISP
- subscriber carrier module-100S remote (SMS-R)

The warm SWACT enhancements are supported on the following commands at the PM level of the MAP terminal attempting a warm SWACT:

- SWACT <no option>
- SWACT ALL
- SWACT FORCE
- SWACT NOW
- SWACT TEST
- BSY UNIT <unit_no> (where unit_no is the active unit)

- BSY ACTIVE
- TST REX NOW (provided by feature AF5008, XPM REX Control and Trouble Notification Improvements)

The following are also supported:

- REX initiated by the system
- warm SWACT initiated by the XPM

In the event of a SWACT back, all calls made after the SWACT and before completion of the SWACT back are taken down.

The system cannot automatically recognize that a card has been replaced to repair a fault on which the SWACT controller bases a SWACT decision.

If the fault is a fault used by the SWACT controller and stored in the history database in the CC (by feature AF5006, PM Diagnostic History), the SWACT controller continues to deny a SWACT to the unit for which the fault was repaired until the fault counters for that unit are cleared. The operating company personnel must cause that unit to successfully gain activity to clear the fault counters. Option FORCE of command SWACT can be used for this purpose.

If the fault is used by the SWACT controller and stored in the status information in the XPM (by feature AF5006), the SWACT controller continues to deny a SWACT to the unit for which the fault was repaired until the fault indicators for that unit are cleared. The XPM must run the appropriate diagnostics and these must pass for the fault indicator to be cleared.

Operational measurements (OM) and peg counts are not reinitialized following a SWACT back. Data will be lost for the 5-s time period that it may take to SWACT and SWACT back.

When a SWACT back occurs, no OM counts for the two transfers of activity (SWACT and SWACT back) are incremented. Affected counters are as follows:

- PM2MWXFR Peripheral Module Dual-unit Manual Warm Transfer
- PM2SWXFR Peripheral Module Dual-unit System Warm Transfer
- PMMWXFR Peripheral Module Manual Warm Transfer
- PMSWXFR Peripheral Module System Warm Transfer

This feature is not functional without prior loading of the BCS35 communications module (CM) load.

Feature interactions

This feature requires feature AF5006 (PM Diagnostic History) and is used by AF5008 (XPM REX Control and Trouble Notification Improvements).

Logs

The existing PM181 log that reports a SWACT is enhanced to report that a SWACT override occurs when personnel use option FORCE of command SWACT MAP to override the SWACT controller's denial of a SWACT.

PM181 log is enhanced as follows:

- When users override the SWACT controller, the log indicates which user name performed the override.
- The log that indicates whether a SWACT passed, failed, or aborted contains an override string when appropriate.
- When a SWACT back occurs, the log indicates XPM SWACT Back.

User interface

This feature affects commands BSY, and the SWACT at the PM;POST level of the MAP terminal also affects the TST REX NOW command.

AF5008

Feature name

XPM REX Control and Trouble Notification Improvements

Description

AF5008 creates log PM600 (REX Failed), which is produced upon routine exercise (REX) failure. The log is a record of each maintenance action performed during REX, the extended multiprocessor system (XMS)-based peripheral module (XPM) unit affected, and the time each action began. The log includes the failure reason and, if applicable, supplemental data consisting of the failed diagnostics and card list reported by the XPM. This feature significantly reduces the number of logs produced during REX. This feature also allows REX to use the enhanced pre-activity switch (SWACT) query and SWACT back created by feature AF5007 (XPM Pre-SWACT/Post-SWACT Audit).

BCS history

This feature was created in BCS35.

BCS36 Changed.

Restrictions and limitations

The system REX runs on only one XPM at a time if the office uses the NT40 processor. SuperNode supports concurrent REXs for up to ten XPMs with the same REX test class: line group controller (LGC), remote cluster controller (RCC), subscriber carrier module-100S remote (SMS-R), and message switch and buffer (MSB).

A REX can be run only on a unit in one of the following states:

- in service (InSv)
- in-service trouble (ISTb) due to REX failed
- ISTb due to peripheral-side (P-side) DS-1 links of carrier type trunk OOS (out of service)

If a warm SWACT is not possible, REX terminates rather than performing a cold SWACT.

REX does not fail as a result of the pre-SWACT audit for the following peripheral types that do not support the audit:

- message switch and buffer CCIS6 (MSB6)
- message switch and buffer CCIS7 (MSB7)
- subscriber module access (SMA)
- Traffic Operator Position System (TOPS) message switch (TMS)
- small-memory digital trunk controller (DTC)

After successful completion of the REX, the XPM has a new active unit due to the SWACT.

Operational measurements (OM) normally generated for certain system actions are suppressed if REX initiates these actions.

The last REX date and time stored in the maintenance record may be due to either a system REX or manual REX, and is measured from the last system reload restart.

The REX maintenance record does not survive BCS applications.

If a restart occurs while REX is in progress, log PM600 is not generated, because the restart aborts the REX and deallocates the temporary data store used to build the PM600.

The capture and MAP display of diagnostics that fail during XPM REX applies to all XPMs.

Log PM600 and associated log reduction provided by this feature applies to the following XPMs:

- line trunk controller (LTC) and LTC with unified processor (UP) (LTC+)
- line group controller (LGC) and LGC with UP (LGC+)
- digital trunk controller (DTC), DTC with UP (DTC+), DTC7
- remote cluster controller (RCC), RCC with UP (RCC+), and ISDN RCC with UP (RCCI+)
- subscriber carrier module-100S (SMS) and SMS with UP (SMS+)
- subscriber carrier module-100 access (SMA)
- subscriber carrier module-100 remote (SMR)
- subscriber carrier module-100 urban (SMU) and SMU with UP (SMU+)
- enhanced subscriber carrier module-100 urban (ESMU)
- subscriber carrier module-100S remote (SMS-R) and SMS-R with UP (SMS-R+)

No SWACT controller override is provided for REX.

Feature interactions

This feature requires feature AF5007 (XPM Pre-SWACT/Post-SWACT Audit) for REX to use the enhanced pre-SWACT audit, post-SWACT audit, and SWACT back capability.

Logs

Log PM600 (REX Failed) is produced if a REX fails. The log is a record of each action performed during REX (BSY, RTS, TST, SWACT, pre-SWACT, or SYNC), which unit the action affected, when the action was initiated, the failure reason, and supplemental data consisting of diagnostics that failed, applicable card list, or list of problems detected by the pre-SWACT audit.

Log PM600 allows the suppression of multiple logs during REX (a REX pass produces 3 logs instead of 17; a REX failed produces 3 logs instead of up to 32 logs).

User interface

REX failure reasons are updated to specify, if applicable, the unit with a failure and the diagnostics that failed. If REX fails during the pre-SWACT step, TST REX QUERY displays the reason for pre-SWACT failure.

AN0173

Feature name

Carrier Identification Code for E800/PVN

Description

Prior to the introduction of this feature the carrier identification code (CIC) was a three-digit code. This limited the number of CICs to a theoretical maximum of 1 000. For the enhanced 800 (E800) and Private Virtual Network (PVN) database services, this feature provides the equal access end office (EAEO) service switching point (SSP) and the access tandem (AT) SSP with the ability to request and accept four-digit CICs from the switching control point (SCP). This raises the theoretical maximum number of CICs to 10 000.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature does not change table TOPECAR to support a four-digit CIC. Under certain conditions E800 calls completing to the inter-LATA (local access and transport area) carrier (IC) use table TOPECAR, field CARDIG, to look up the CIC. If the SCP returns a four-digit CIC and the CIC is not datafilled in table OCCINFO, the leading digit, if zero, is stripped off and the lookup is performed in table TOPECAR. If the leading digit is not zero, the call is routed to treatment.

Similarly, this feature does not change table CLSVSCRC to support a four-digit CIC. Under certain conditions, E800 calls originating at an AT SSP over TOPS trunk groups using feature group C (FGC) signaling use tables TOPECAR and CLSVSCRC to determine the call completion route. If the SCP returns a four-digit CIC, the leading digit is stripped off and the resulting three-digit CIC is used in tables TOPECAR and CLSVSCRC

Feature interactions

This feature builds on features NC0335 (FGD Carrier Identification Code Expansion) and NC0428 (FGD CIC Expansion-PH2) by completing the changes to allow an EAEO or AT to accept four-digit CICs.

Datafill

Table	Description
NSCDEFS	New option 4DGTCIC added
STDPRTCT. STDPRT	Field MAXDIGSR maximum value changed from 18 to 25

Office parameter SSP_NSC_CARRIER_ID is changed to accept a four-digit service code.

Logs

Logs DFIL 110 and DFIL 111 are changed to output a four-digit CIC in the log text.

User interface

The output from command TESTSS at the SCCPLOC level of the MAP is changed to print either a three-digit or a four-digit CIC. The output is based upon the size of the CIC received in the response package from the SCP.

Automatic message accounting

This feature changes existing billing records produced for E800 and PVN to include the four-digit CIC returned from the SCP. The IC/INC prefix field of the E800 141 AMA billing and the PVN 021 carrier access module code are redefined to include a four-digit CIC.

AF4252

Feature name

SMU with SPECCONN Link Reconfigurations

Description

This feature allows C-side links of ISDN remote carrier urban (RCU) having ISDN/Meridian Business Services (MBS) special connections to be reconfigured from one ISDN enhanced subscriber carrier module-100 urban (ESMU) to another while the ESMUs are in service and no four-wire or two-wire special connections exist on the RCU. A link can be reconfigured on to the same ESMU or another ESMU by means of a single change to table RCUINV.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature only supports reconfiguration of RCU from and to ISDN ESMUs.

Reconfiguration cannot be carried out if two-wire or four-wire special connections exist, or if one or more logical terminal identifiers (LTID) is provisioned.

The RCU, and its associated C-side links, must be manually busied (MANB) or taken offline (OFFL) before reconfiguration is attempted.

If the RCU being reconfigured has more that 10 ISDN signaling groups (ISG) assigned, then the associated ESMUs must be set to MANB condition.

Any link reconfiguration should ensure that sufficient ESMU C-side capacity remains for existing special connection (SPECCONN) and call processing requirements.

If a C-side node of an RCU is returned to service during reconfiguration, a static data mismatch between the central control (CC) and the ESMU may occur. If this happens, the ESMU should be removed from service and returned to service once reconfiguration is completed.

Datafill

Table	Description
LNINV	New replies created
RCUINV	New replies created
SPECCONN	New replies created

User interface

The busy command of an RCU fails if it is attempted on an offline RCU under reconfiguration.

AF4836

Feature name

ESMU: MX77 Support (XPM)

Description

This feature is introduced to ensure that there is no loss of functionality in the enhanced subscriber carrier module-100 urban (ESMU) as a result of the introduction of the NTMX77AA card (unified processor circuit pack). This pack replaces two NT6X45BA cards (master processor [MP] and signaling processor [SP]), the NT6X47AC card (MP memory) and the NT6X46BB card (SP memory).

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires an ESMU equipped with the NTMX77AA card and the NTB01AB card (enhanced ISDN signaling processor).

Feature interactions

This feature is part of an integrated package and requires the following features in order to function correctly:

- AF4861 MX77 for SMU
- AF4512 ISDN/MBS SMU Unified Processor Support
- AF4837 ESMU: MX77 Support (CC)

Feature name

ESMU: MX77 Support (CC)

Description

This feature provides the necessary software changes in the central control (CC) to allow the NTMX77AA card (unified processor [UP] circuit pack) to replace four existing packs in the enhanced subscriber carrier module-100 urban (ESMU). It ensures that the UP card can be integrated into the ESMU with no loss or degradation of existing functionality.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires an ESMU equipped with the NTMX77AA card and the NTB01AB card (enhanced ISDN signaling processor).

The ESMU requires a backplane modification (NT6X01) to upgrade to the UP.

Restrictions and limitations

This feature does not support the NTMX77AA card on a subscriber carrier module-100 urban (SMU) without ISDN/MBS capabilities.

BCS applications to BCS37 and above will require that all ESMUs are upgraded to include the UP.

Feature interactions

This feature interacts with the following features to enable the use of the NTMX77AA card:

- AF3732 XPM Software Modifications for UP in Base XPM
- AF3733 CC Software Modifications for UP in Base XPM
- AL2540 Unified Processor Integration in ISDN LTC
- AF4512 ISDN/MBS SMU Unified Processor Support
- AF4836 ESMU: MX77 Support (XPM)

Datafill

Feature AF4512 provided the ability to datafill MX77 in table LTCINV. This feature ensures that the datafill and upgrade function correctly.

AF4861

Feature name

MX77 for SMU

Description

This feature provides the necessary software changes in the extended multiprocessor system (XMS)-based peripheral module (XPM) to allow the NTMX77AA card (unified processor [UP] circuit pack) to replace four existing packs in the subscriber carrier module-100 urban (SMU). It ensures that the NTMX77AA card can be integrated into the SMU with no loss or degradation of existing functionality.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires an SMU equipped with the NTMX77AA card.

The SMU requires a backplane modification (NT6X01) to upgrade to the UP.

Feature interactions

This feature interacts with the following features to enable the use of the NTMX77AA card:

- AF3732 XPM Software Modifications for UP in Base XPM
- AF3733 CC Software Modifications for UP in Base XPM
- AF4512 ISDN/MBS SMU Unified Processor Support
- AF4836 ESMU: MX77 Support (XPM)
- AF4837 ESMU: MX77 Support (CC)

Feature name

ESMU EDCH Integration

Description

This feature provides for the integration of the NTB02BA card (enhanced D-channel handler [EDCH] circuit pack) into the enhanced subscriber carrier module-100 urban (ESMU). It includes all necessary software changes.

The EDCH is an upgraded version of the NTB02AA card (ISDN D-channel handler [DCH]) with a full 32-bit data bus, 4 Mbyte of RAM, and a processor running at 20 MHz.

Incorporation of the EDCH into the ESMU provides the necessary capacity and performance to prepare for increased functionality in BCS36 and later software releases.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the NTB02BA card.

Restrictions and limitations

The EDCH card can exist on both the master processor/signaling processor/ISDN signaling processor (MP/SP/ISP) platform and on the unified processor/enhanced ISDN signaling preprocessor (UP/EISP) platform. However, the EDCH software can exist only on the UP/EISP platform.

An EDCH card with an EDCH load cannot be spared to a DCH card with a DCH load.

A cold activity switch (SWACT) of the extended multiprocessor system (XMS)-based peripheral module (XPM) is required if the active unit contains a UP/EISP/EDCH configuration with an EDCH load in some or all of the EDCHs, and if the inactive unit is configured with an MP/SP, ISP, or EISP.

Logs

All logs that reference the NTB02AA card are modified to reflect the addition of the NTB02BA circuit pack.

Feature name

TA RCUINV: New Field for Equipment Location

Description

This feature provides the ability to store the location or address of a remote carrier urban (RCU) and to display that information in the PM128 log report.

BCS history

This feature was created in BCS36.

Datafill

Table	Description
RCUINV	Field LOCATION added

Logs

Log PM128 is changed to display the location information datafilled in field LOCATION of table RCUINV for the relevant RCU.

NTX398AA

SCM-100S

This feature package applies to DMS-100 offices.

Feature package contents

NTX801AA	Toll Features I
NTX187AA	TOPS - Equal Access
or NTX386AA	Access Tandem Switch
or NTX386AB	Access Tandem Switch

AN0304

Feature name

Interchangeable NPAs for LEAS

Description

This feature is an upgrade to the existing Local Equal Access System (LEAS) base package and does not alter the LEAS functionality. It only extends its engineering limits by increasing the number of datafilled Numbering Plan Area (NPAs) in table DNPIC (LEAS InterLATA PIC) and DNLPIC (LEAS IntraLATA PIC) from 160 to 800. This feature also modifies Command Interpreter (CI) command DNPICLIST to support the expanded range. This command is used for reporting database presubscription for LEAS.

BCS history

This feature was created in BCS36.

Datafill

This feature will increase the data store requirements for table DNPIC and table DNLPIC from 640 bytes to 3200 bytes for each table regardless of the package upgrade is present or not.

User interface

This feature will modify the Command Interpreter (CI) command DNPICLIST to support the new NPA range format of NXX.

AR0496

Feature name

DCH/EDCH State Audit

Description

This feature enhances the current D-channel handler (DCH) or enhanced D-channel handler (EDCH) audit and includes a check of the congestion and overload status. The MAP (maintenance and administration position) and logs are updated appropriately.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The overload and congestion state audits apply only to DCHs with a host extended multiprocessor system (XMS)-based peripheral module (XPM) that has a unified processor (UP) in the active state.

This feature will support XPM switch of activity (SWACT) from a master processor (MP) or signaling processor (SP) to a UP, but not in the other direction.

Logs

The audit part of this feature ensures the correct printing of PM270 logs for DCHs with host XPMs that have UPs in the active state.

AF4841

Feature name

RSC-S LCME Link Rearrangement

Description

This feature permits reconfiguration of the C-side links of an enhanced line concentrating module (LCME) with common peripheral module (CPM)-based ISDN compact remote cluster controller (RCC2) without deleting the special connections on these links from their respective inventory tables and subsequently re-adding them to the tables.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The C-side links of an LCME can be reconfigured on to an extended multiprocessor system (XMS)-based peripheral module (XPM) or to a remote XPM with ISDN capabilities.

Ensure that there is sufficient LCME C-side capacity for the existing SPECCONN and call processing requirements before starting C-side link reconfiguration.

All of the logical terminal identifiers (LTID) relating to the line equipment number (LEN) of an LCME must be deleted from inventory table LTMAP before the C-side links of that LCME can be reconfigured.

All of the digital test access (DTA) connections on an LCME must be deleted before the C-side links of that LCME can be reconfigured.

The LCME must be put in an offline state before the C-side links are reconfigured.

Only one reconfiguration is allowed at any time. If another reconfiguration is attempted while one is in progress, the attempted reconfiguration is rejected.

During the C-side link reconfiguration process, no changes are allowed to special connections in inventory table SPECCONN or to time division multiplexed (TDM) connections in table LNINV if either involves an LCME.

If the link configuration is carried out while the XPM is in emergency stand-alone (ESA) mode and if the XPM then exits the ESA mode while in the warm state, a static data mismatch will result.

Reconfiguration is restricted to one link at a time if the LCME is reconfigured on to the same XPM and the XPM is not in an out-of-service state. There is no restriction if the XPM is in an out-of-service state.

If the LCME is reconfigured from one XPM on to another XPM, both XPMs must be in an out-of-service state.

If the reconfiguration process is abruptly terminated (for example, by a system restart or spontaneous error condition), subsequent maintenance activity on that LCME will be blocked until the end of the audit process that restores the data structure associated with the reconfiguration. This can take up to 15 minutes.

Feature interactions

This feature extends the capabilities of features AL1629 (Link Reconfiguration for XPMs with Special Connections) and AJ2328 (PCM30 SPECCONN and Dynamic Reconfiguration Robustness).

Feature name

RSC-S Layer 1 Performance Monitoring

Description

This feature extends to the ISDN common peripheral module (CPM) compact remote cluster controllers (RCC2) the functionality provided by the following features:

- AL2040 Bd Channel Logical Loopback
- AL2279 DCH Performance OMs (XPM)
- AL2280 DCH Performance OMs (CC)
- AL1674 Layer Performance Monitoring for 2B1Q Loops
- AQ0947 Multipoint EOC 1 (CC)
- AQ0948 Multipoint EOC 1 (XPM)

Bd channel logical loopback provides the logical loopback capability between the D-channel handler (DCH) and the packet handler (PH) in the Data Packet Network (DPN) for a particular ISDN logical terminal (LT). The LT is identified by its logical terminal identifier (LTID). The loopback helps to determine if there is a fault within or outside of the DCH.

DCH performance operational measurements (OM) provide the central office (CO) personnel with a means of monitoring the CPU occupancy and possible overload of DCHs.

Layer 1 performance monitoring provides layer 1 surveillance of ISDN two-binary, one-quaternary (2B1Q) loops terminating at an enhanced ISDN line concentrating module (LCME).

Multipoint embedded operations channel (MP-EOC) allows maintenance personnel to determine the MP-EOC configuration of a 2B1Q loop, to perform diagnostics on 2B1Q lines equipped with MP-EOC, and to set or release a B1, B2 or 2B+D loopback at any one of the MP-EOC line units.

BCS history

This feature was created in BCS36.

Hardware requirements

For layer 1 performance monitoring using this feature, the LCME must be equipped with the appropriate common cards, as well as the following ISDN cards:

- NTB27AA ISDN 2B1Q line card
- NTB26AA ISDN S/T line card

The NTB26AA card is required only if this type of loop supports change of S/T synchronization (TSYNC) reporting.

For MP-EOC using this feature, the LCME must be equipped with the appropriate common cards, as well as the following equipment:

- NTB27AA ISDN 2B1Q line card
- ISDN line extension equipment
- Network termination 1 (NT1) that complies with Bellcore technical reference TR-TSY-000829

Restrictions and limitations

The restrictions and limitations applicable to the features listed in "Descriptions", above, also apply to this feature.

Due to interaction problems with emergency stand-alone, activity switches, and restarts, it is recommended that all Bd channel logical loopbacks and multipoint line unit loopbacks (MPLU) be removed prior to performing these maintenance activities.

DCH performance OMs may be lost during during periods of stand-alone operation.

This feature does not address the MP-EOC items of Bellcore technical reference, *Operations Technology Generic Requirements (OGTR): Embedded Operations Channels* (TR-TSY-000829, issue 1).

Operational measurements

This feature ensures that operational measurement (OM) groups ISGCPU and ISGOVLD will be supported for ISDN services group (ISG) DCHs resident in an ISDN RCC2. No changes are made to the existing registers in these groups.

User interface

If an attempt is made to add layer 1 data for a line equipment number (LEN) resident on a remote unit that does not support layer 1 performance monitoring, a message is returned to the MAP. This message has been changed, as follows:

- Old message - The loop must not be on a REMOTE
- New message - The loop is on REMOTE not supporting this function

Feature name

EDCH Patcher CC Part

Description

This feature provides the Central Control (CC) portion of the Enhanced D-Channel Handlers (EDCH) patcher feature. Its purpose is to provide the man machine interface, utility routines and loader routines which are required to support basic patching commands for EDCHs. This feature also provides the messaging required to send patch records from the computing module (CM) to EDCH devices. EDCH source code patching will be supported only on the ENhanced D-Channel Handlers (DCH) loads on peripheral devices with XMS-based Peripheral Module (XPM) Plus architecture.

This other features being developed in conjunction with this feature are:

- AG3335 EDCH Patcher - CC Base Part
- AN0320 Patch Generation Tool
- AF4849 EDCH Source Code Patch Tool
- AF4840 EDCH Patcher Communication Link
- AR0524 EDCH Patcher XPM part.

BCS history

This feature was created in BCS36.

Restrictions and limitations

In order to patch a DCH, the following state conditions must be met:

- The XPM containing the DCHs cannot be in a system busy (SYSB), manually busy (MANB), c-side busy (CBSY), or off-line state (OFFL)
- The DCHs themselves cannot be in a system busy (SYSB), C-side busy (CBSY), or off-line state (OFFL)

DCH sparing will not be deactivated during the patching process. In the event that sparing occurs while patching the spare and/or the DCH that is currently attempting to spare, the patch command being performed (apply remove etc.) will fail.

This feature and its companion features will provide source code patching capability only for EDCH loads on the XPM Plus architecture.

When loadset patching, has part of the loading process or a single DCH from the CI commands, if a patch in the loadset fails, the remainder of the patches will not be applied to that DCH. If a patch fails during the loading process on a specific DCH, only that DCH is removed from the patching set.

Feature interactions

This feature is being developed in conjunction with features

- AN0320 Patch Generation Tool
- AF4849 EDHC Source Code Patch Tool
- AF4840 EDCH Patcher Communication Link
- AR0524 EDCH Patcher XPM part.

This feature requires AF4840 and AR0524 to be present in the XPM and EDCH software loads in order to function.

The time required to load a DCH may increase due to the addition of the patching step in the loading process.

Logs

The following logs are updated to output DCH identifier(s) in the log:

- PCH104 (patch action successful) Log
- PCH105 (patch action failed) Log
- PCH106 (patch audit successful) Log
- PCH107 (patch audit failed) Log

User interface

A number of Patcher CI commands are updated to include the ability to patch DCHs. The following list of commands support the patching DCHs. The syntax for all of the patching commands required to patch DCHs has not changed. The DCHs will be considered as a 'PM' device.

The NODESET command is used to develop sets of peripheral devices that can patch actions performed upon them. THE NODESET command has four parameters:

- ADD: to add a DCH or a range of DCHs to an existing nodeset or to create a new nodeset with the specified DCH(s).
- REMOVE: to remove a DCH or range of DCHs from a nodeset.
- DELETE: deletes an entire nodeset.
- QUERY: provides a list of DCH(s) in the nodeset.

The APPLY command is used to apply DCH patches to a single DCH or a nodeset of DCHs.

The CHECK command is used prior to applying a patch to ensure that the conditions for applying the patch have been met. In the case of DCHs this means that the correct loadname must be in the DCHs and all the patches needed by the patch being applied must be present and applied in DCH. In

addition, the old code in the DCH is matched with the old code section of the patch to ensure that the code being replaced is the code that you wish to have replaced.

The MATCH and MATCHALL commands are used to determine mismatches between the CM patch database and the actual status of patches applied in the DCH. The MATCH command is used to match the status of a single DCH while the MATCHALL command is used to determine the status of all DCHs.

The INFORM command is used to allow the craftperson access to the CM patch database information. This information can be accessed in a number of ways (by date, DCHs, patched, by patch etc.)

Feature name

DCH/EDCH State Audit

Description

This feature enhances the current D-channel handler (DCH) or enhanced D-channel handler (EDCH) audit and includes a check of the congestion and overload status. The MAP (maintenance and administration position) and logs are updated appropriately.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The overload and congestion state audits apply only to DCHs with a host extended multiprocessor system (XMS)-based peripheral module (XPM) that has a unified processor (UP) in the active state.

This feature will support XPM switch of activity (SWACT) from a master processor (MP) or signaling processor (SP) to a UP, but not in the other direction.

Logs

The audit part of this feature ensures the correct printing of PM270 logs for DCHs with host XPMs that have UPs in the active state.

ISDN Supplementary Services Compliance

This feature package provides the ISDN equivalent of the Meridian Digital Centrex Three-Way Calling/Call Transfer feature.

This feature package applies to ISDN offices.

Feature name

TR-855 Terminal Portability Compliance

Description

AF3555 provides the first step toward DMS-100 compliance with Bellcore technical reference TR-855 (ISDN Automatic Callback). This feature implements Ring Again (RAG) so that it works similar to the TR-855 specification for Automatic Call Back (ACB). AF3555 introduces the following activities:

- using a notify message to inform party A (terminal that invoked RAG) that party B (monitored terminal) has become idle
- saving the following information on RAG calls so that the data can be used in RAG recall (however, this information is not presented in notify message):
 - called directory number (CDN)
 - called party subaddress (CDS)
 - calling directory number (CGN)
 - calling party subaddress (CGS)
- checking for compatibility between the bearer capability (BC) of the recall against the BC of the original call, before the RAG recall is completed

BCS history

This feature was created in BCS34.

BCS36 Changed

Restrictions and limitations

The BC in the setup message is checked and must be compatible with the BC of the notify message before the RAG recall is completed.

No BC, CDN, CDS, CGN, or CGS is present in notify message.

Transfer of a CDN subaddress is available only on an intraoffice call.

Feature interactions

This feature requires the following feature packages:

- NTX106AA-IBN-Proprietary Business Set
- NTX750AB-ISDN Basic Access
- NTX753AA-ISDN Functional Mode Basic Rate Services
- NTX755AA-ISDN Supplementary Services Compliance

NTX755AC

AF3555

This feature also uses feature AC0262 (Network Wide Ring Again).

Feature name

ISDN 3-Way Call/Flex Call Interworking

Description

This feature provides additional flexible calling (FC) capabilities. It allows non-ISDN sets that are linked to an FC chain (FCC) to invoke three-way calling (3WC) and establish a conference to another party. This builds a 3WC/FC chain. The action can be repeated by any of the non-controlling parties in the conference to build a more extensive 3WC FCC.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature allows the chaining of three-party calls only. It does not support the chaining of larger conference calls.

Feature interactions

This feature interacts with feature AF4848 (Flex Call Implicit Transfer) to support implicit transfer.

AF4848

Feature name

ISDN Flex Call Implicit Transfer

Description

With the provision of this feature, implicit transfer is automatically activated for any caller using flexible calling (FC) on a set that is assigned a transfer feature key. Implicit transfer automatically transfers an FC conference whenever the controller disconnects or releases from the call.

BCS history

This feature was created in BCS36.

Restrictions and limitations

If a user's set is not assigned a transfer feature key, implicit transfer is automatically disabled for that set.

In order to implicitly transfer a call, the conference configuration must satisfy the transfer type (XFERTYPE) assigned to the controller's set. If the conference configuration does not correspond to the assigned XFERTYPE, then the entire conference is cleared when the controller exits.

In order to implicitly transfer a call, the conference configuration must also pass the same supervision checks that are applied to feature key transfer requests. If, for example, a feature key transfer would fail due to inadequate supervision, then an implicit transfer request on the same conference would fail, and the entire conference would be cleared when the controller exits.

If a transfer feature key is assigned, implicit transfer is automatically enabled, and the exit messages DISC, REL, or REL COM are interpreted as a request to transfer the conference call. To clear the conference without transferring the other users, the controller must use the DROP key. This reduces the conference to a two-party connection, which can then be cleared in the normal way.

Implicit transfer does not support the form of transfer that allows an FC controller to transfer an active call to a held two-party conference. This is due to the different interpretation of the DISC message.

Feature interactions

This feature enhances the following features:

- AF4847 ISDN 3-Way Call/Flex Call Interworking
- AG1301 Flexible Calling and DN Bridging Capability for ISDN EKTS
- AG3244 3-Port Flexible Call Chaining
- AQ0736 ISDN Six-Port, Thirty-Port Flexible Calling

Feature name

Robustify Cause Handling for PRI

Description

This feature makes the ISDN primary rate interface (PRI) call clearing procedures more robust when handling the cause information element (IE) received in the CCITT-defined Q.931 call clearing messages. It provides cause handling for multiple ISDN protocols, screens cause values that are received at the interface, and provides inband treatment capability when a speech or 3.1-kHz audio call is terminated to intercept treatment.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Due to possible incompatibility in functionality, only the Northern Telecom North American PRI (NTNAPRI) variant is supported by this feature.

The inband treatment subscription flag in field AUDTRMT of table LTDATA has no effect on calls with a bearer capability other than speech or 3.1-kHz audio.

Feature interactions

Cause screening is supported for ISUP to PRI and basic rate interface (BRI) to PRI interworking.

Datafill

Table	Description
LTDATA	Feature enabled by entering Y in field AUDTRMT

NTX797AB

PRI Message Waiting Indication

This feature package allows standardized message activation and deactivation of the Message Waiting indicator to be passed over primary rate interface (PRI) links. This feature package uses Common Channel Signaling 7 (CCS7) to provide a Message Waiting indication against a station served by another switch using CCS7 and PRI signaling. This allows a message service to use a central location to cover multiple business locations over an entire city or a local access and transport area (LATA).

The upgrade to this feature package creates an environment on a DMS switch that enables it to send Network Message Service messages to, and receive messages from, a Meridian-1 switch.

This feature package applies to DMS-100 offices.

Feature name

DMS PRI Message Waiting Indicator Interwork with SL-1

Description

The Network Message Service (NMS) allows a message center connected to one switch to activate or deactivate the message-waiting indicators (MWI) of users who are located on a different switch. This feature creates an environment on a DMS switch that allows it to send NMS messages to a Meridian-1 switch and to receive NMS messages from the Meridian-1 switch.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature assumes that each customer using a different network identifier has a separate message center directory number (DN).

For interworking between a DMS switch and a Meridian-1 switch, this feature requires the following software at the point of contact between the two types of switch:

- BCS36 on the DMS switch
- Release 19 on the Meridian-1 switch

To support 10-digit user DNs, Meridian Mail release 8 is required.

This feature provides the changes to the DMS switch only. A corresponding change must be made to the Meridian-1 switch to permit successful interworking.

Meridian-1 NMS voice mail softkey update messages are ignored if the destination is a DMS switch.

NMS can work between a DMS switch with BCS36 software and a DMS switch with BCS35 software.

This feature does not support intelligent services networks (ISN).

Manual message center on a DMS switch is not supported.

This feature supports only the activation and deactivation of the MWI.

Network message service identifications (NMSID) must not conflict. An NMSID must not conflict with number plan areas (NPA) of the DNs using the message center. The first digit of an NMSID must not be 1 or 2.

Table MSGRTE at the customer's switch must convert the destination DN to a valid 10-digit public DN.

Message Centers connected to a Meridian 1 switch cannot activate MWIs on a DMS switch with pre-BCS36 software.

Customers who use a 10-digit public DN as a notification address must use simplified message desk interface (SMDI) desk 63, otherwise the message center DN sent in the notification will be incorrect.

The selected NMSID must not cause the customer's DN to exceed 10 digits, as this is the maximum DN size that the SMDI link can support.

On a forwarded call, the calling DN and the customer's DN must be in the same customer group, otherwise Meridian Mail may treat the call as an external call.

Feature interactions

This feature alters the way that per-trunk signaling (PTS) trunks forward.

Datafill

Table	Description
NMSDATA	New table. Stores NMSID and network identifier against a message center DN
MSGRTE	Option NEWTOR added to set the type of route indicator in the destination information element of a facility message
SLLNKDEV	Option NMSPVT added to identify SMDI interfaces that support the sending of private DNs

Feature name

SRC Controlled Restart and No-Restart SWACT for CCS7

Description

This feature allows the system recovery controller (SRC) to control the recovery of Common Channel Signaling 7 (CCS7) links, linksets, routesets, and pools during warm, cold, and reload restarts, or during a no-restart switch of activity (SWACT).

BCS history

This feature was created in BCS36.

Restrictions and limitations

The no-restart SWACT for CCS7 offices is a function of office size, and certain configurations may not meet the target maximum of 30 seconds for complete switch recovery. Partial call processing will be available within the 30-s limit.

This feature does not support the CCS7 part of service control point I (SCPI) nodes.

This feature does not support the CCITT-based versions of signal connection control part (SCCP).

Feature interactions

This feature is one of four features that function together to allow CCS7, link peripheral processors (LPP), and ISDN user part (ISUP) to use the SRC for core restart recovery. The other features are as follows:

- AI0704 SRC Restart and No-Restart SWACT Support for SCCP and DDM
- AI0705 SRC Restart and No-Restart SWACT Support for LIMs and LIUs
- AR0467 SRC Restart and No-Restart SWACT Support for ISUP

NTX891AA

TOPS-Exchange Access Opr Serv Sig

This feature package applies to DMS-100 offices.

NTX098AA	Bellcore CAMA Format
NTX187AA	TOPS-Equal Access

AN0325

Feature name

TOPS Operator Hold Enhancements

Description

This feature allows operator hold to be datafilled on an outgoing trunk group basis for incoming exchange access operator services signaling (EAOSS) calls on Traffic Operator Position System (TOPS) trunks, and outgoing on access to tandem carrier (ATC) trunks. If a carrier fails to release this type of call, it could be left in an operator hold state, so this feature also provides a datafillable timeout (EAOSS with feature group C (FGC)) to protect trunks and other equipment from being unexpectedly locked up.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The implementation of operator hold by this feature does not apply to calls or trunks using signaling system 7 (SS7).

The operator hold capability provided by this feature is only provided for calls to carriers that are not already provided with operator services by the operating company. It is not provided for TOPS inter-LATA (local access and transport area) carrier services (TICS) calls.

Datafill

Table	Description
TRKGRP.ATC	Fields OPRHOLD and HLDTIMER added

Logs

Log TOPS 122 is provided as part of this feature. The log appears under the following circumstances:

- If a TOPS call with operator hold is released because the operator hold timeout timer has expired
- If an off-hook signal is returned from the carrier to the TOPS access tandem (AT) and operator hold is not datafilled for the call

In the first case, the message OPRHOLD_EXPIRED will appear. In the second case, the message UNEXPECTED_OPRHOLD_OFFHOOK will appear.

Automatic message accounting

If operator hold is applied, and the operator hold timeout timer is invoked for a call outgoing on an ATC trunk group, the call will be released when the carrier releases it, or when the timer times out.

The wording in the inter-LATA/international carrier (IC/INC) call event status has been modified to recognize that an off-hook signal may be returned instead of the acknowledgement wink.

Module code 053 table descriptions have been extended or reworded to reflect the provision of operator hold.

This feature package applies to DMS-100 offices.

NTX901AA

AN0114

Feature name

LINEDATA Re-Engineering

Description

This feature is part of a quality re-engineering program directed at areas of DMS software which are particularly error-prone. This feature will improve the reliability and maintainability of the existing LINEDATA software.

BCS history

This feature was created in BCS35.

Feature name

LTP Enhancement

Description

This feature increases the number of line test positions (LTP) on the MAP from 15 to 64. It also provides a means of releasing the LTP resources allocated to a user when that user has been away from the LTP level for more than one hour.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The maximum number of LTP users is 64.

The maximum number of LTP users that can actively perform tests is dependent upon the quantity of available test equipment. If no test equipment is available, error messages are displayed.

Feature interactions

This feature requires 4 kbyte of data store for each LTP user.

User interface

This feature adds one LTP level hidden command, LTPRSRC, which is associated with the LTP resource release mechanism. The LTP resource release mechanism is invoked automatically when a user has been away from the LTP level for one hour, and frees the user's LTP resource. Command LTPRSRC allows the user to remove the LTP from the automatic release mechanism, or to return it to automatic control, as required. A query option allows the user to obtain information about the LTP resources and users.

NC0495

Feature name

Off-hook Testing

Description

NC0495 provides an automatic off-hook balance test to determine whether a subscriber line should be on a 900 ohm + 2 μ F (900+2) balance network or on a loaded or non-loaded balance network. This feature is applicable to subscriber line circuits where a selectable line balance network is employed.

BCS history

This feature was created in BCS35.

Restrictions and limitations

This feature supports balance network tests on originating calls only.

This feature is available on domestic DMS-100 switches only.

Datafill

Table	Description
LNADMIN	Table added to datafill office administration parameters required for off-hook balance test
LNBNV	Table added to datafill balance test information for each line

Logs

This feature adds logs LINE220 to 222.

Log LINE220 is generated when the off-hook BNV test indicates that the recommended BNV is the same as the existing BNV.

Log LINE221 is generated when the off-hook BNV test indicates that the recommended BNV is different than the existing BNV.

Log LINE222 is generated when the off-hook BNV test does not complete the line test.

User interface

This feature adds command QBNV at the CI level of a MAP terminal. Command QBNV displays a range of lines with the existing balance network value (BNV) and the associated recommended BNV.

This feature package applies to DMS-100 offices.

Feature name

Integrated Node Maintenance (INM) LoadPM Enhancements

Description

This feature provides enhancements to the Integrated Node Maintenance (INM) LOADPM and PMRESET maintenance operations in the following areas:

- Disabling fault handling on Integrated Line Maintenance (ILM) Links and Message Channels terminating on an INM node prior to expected resets or restarts of that node
- Using a Who Am I (WAI) event as an acknowledgement of a successful RESET
- Allowing INM to control load activation instead of node firmware autonomously activating the load after booting
- Not giving the default cardlist if the node is manually isolated

BCS history

This feature was created in BCS36.

Restrictions and limitations

The following restrictions and limitations apply:

- Fault Handling Disable is only supported for INM nodes with ILM maintained links. These nodes include AP, FP, and HSI. For other nodes, the Fault Handling Disable function provides no visible behavior change.
- Load Setup and Run message is optional for all INM nodes.
- WAI support is optional.

Feature interactions

This feature interacts with the existing INM Central Agent LOADPM and PMRESET state machines.

TOPS-MP Terminal Handler High Speed

Feature name

Customer Configurable Keyboard

Description

This feature provides Traffic Operator Position System (TOPS) multipurpose position (MP) customers with the ability to custom configure the keyboards of their TOPS-MP operator positions. It allows total flexibility in the layout of the keyboard to optimize keyboard usage and convenience, to introduce letters or symbols not currently available, and to help in the creation of keyboards for foreign languages.

BCS history

This feature was created in BCS36.

Restrictions and limitations

All MPs that connect to a single TOPS position controller (TPC) must use the same keyboard layout. Datafill of the keyboard layout is performed at the TPC level.

Care must be taken to ensure that changes to the keyboard datafill are coordinated with changes to the corresponding keycaps.

User interface

A new TAMI menu is added to allow the key action table to be datafilled. The existing copy datafill function is extended to include the key action table.

Enhanced Network-Basic

This feature package supports the deployment of the enhanced network (ENET) as an additional switching matrix subsystem type for DMS SuperNode. ENET is a single-stage, nonblocking, junctorless time switch that can expand capacity from 4000 to 128 000 unidirectional channels in each plane of a single cabinet.

This feature package applies to DMS SuperNode offices.

Feature name

Support for Warm SWACT Recovery Time Reduction Feature

Description

AL2660 enhances the current ENET system recovery mechanism and ensures proper recovery of ENET nodes, cards, and links after a no-restart warm switch of activity (SWACT)

BCS history

This feature was created in BCS33.

BCS36 Changed

Restrictions and limitations

This feature applies only to switches equipped with ENET.

Feature interactions

This feature interacts with the following features:

- AG2149 CCWarm SWACT Restart Outage Reduction-Phase I
- AG2276 CCWarm SWACT Restart Outage Reduction-Phase II
- AQ0738 DMS-Bus SWACT Reduced Restart High Level Design

Datafill

Table	Description
ENMLASST	New table. This table is used for dump and restore only and cannot be datafilled by the customer.

This feature package provides the maintenance and control software resident in the Ethernet interface unit (EIU). The EIU, together with support circuitry, manages the lower levels of the communications protocol. The signaling message's access to the rest of the node is managed by the link peripheral processor (LPP) local message switch (LMS), which uses the same architecture as the DMS-bus.

The EIUs are located in the LPP frame and provide a protocol gateway into the DMS-100 environment. They support communications to and from an Ethernet LAN that serves terminals, workstations, modem accesses, and BX.25 serial accesses.

This feature package applies to DMS-100 offices.

AR0022

Feature name

IP Route Path Display

Description

This feature provides a tool for the display of the route taken by Internet Protocol (IP) datagrams transmitted from one SuperNode host to any destination that can be specified by its IP address.

BCS history

This feature was created in BCS36.

Restrictions and limitations

If two or more users try to employ the same source IP address then only one of them will be services and the rest will get a message saying that the tool server is busy. Note that if the server is actually executing a test at that time, it may not reply promptly causing the client to time out.

The user can not issue multiple requests. Given a pair of source and destination nodes the user has to wait for the tool to terminate and display all results before he can issue a new source/destination.

User Datagram Protocol (UDP) has to be present in every node that is used as a source node for sending IP datagrams.

There are two methods for tracing. The first, called Record Route (RR) can trace that path to-and-from a destination; however, only 9 IP addresses can be saved due to IP header size limitations. The second, called Time To Live (TTL) can trace the path to a destination. No upper bound on the number of IP addresses when using this method; however, it takes more time than using RR.

User interface

A command increment (IPRPDCI) provides the user interface for specifying the source and destination nodes, the number of IP datagrams to be sent and the information that the user wishes to see about all possible paths.

NTXF06AA

Feature name

Application Processor Split Mode

Description

Application processors (AP) provide a provisionable multicomputing environment for use by applications such as call processing. This feature provides AP split mode functionality, assigning separate links to the inactive processor and allowing the two processors to operate independently.

BCS history

This feature was created in BCS36.

Hardware requirements

In order for split mode to operate correctly, the AP and file processor (FP) must be equipped with NT9X13LA (AP/FP 68030 HPM-based CPU card) circuit packs that are release 187 or greater.

Feature interactions

This feature functions in conjunction with the following features:

- AL0963 High Level Design for Multi-CM
- AL1121 RP Link Maintenance
- AL1664 MRS Development and AP Split-Mode Messaging Study
- AL2131 MRS Enhancements
- AR0078 Application/Port Mtc II
- AR0124 ILM Fault Isoilation Enhancements

Logs

The AP port card state change log AP502 will be modified to show when the AP enters and exits split mode.

User interface

This feature introduces a new AP plane port card man-machine interface (MMI) state when the AP enters split mode. This state is indicated on the inactive PORT CARD of the AP plane level by a colon (:).

AL1975

Feature name

Application Processor Load Mate

Description

The SuperNode multicomputing base (SMB) has been developed to provide expanded computing resources within the DMS SuperNode environment. One node class introduced under SMB is the application processor (AP). APs provide a multicomputing environment for use by applications such as call processing.

This feature implements AP loadmate functionality. AP loadmate loads the inactive plane of an AP-based peripheral module through the DMS-bus while the AP is running in split mode.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Option INACTIVE of the LOADPDM command must be specified in order to initiate the AP LOADMATE process.

Feature interactions

This feature interacts with the following features to provide the AP loadmate functionality:

- AL1974 Application Processor Split Mode
- AL1111 Integrated Node Maintenance
- AL1195 Central RP Control II
- AL1664 MRS Development and AP Split Mode Messaging Study
- AL2131 MRS Enhancements
- AL1121 RP Link Maintenance
- AL0963 High Level Design for Multi-CM

User interface

This feature creates one new command, LdMate, at the AP PLANE level of the MAP (maintenance and administration position). This command is used to initiate the AP LOADMATE process.

This feature also modifies the LOADPDM command at the AP NODE level of the MAP.

Feature name

SM Node MAP Enhancements

Description

This feature implements changes to the application processor (AP) MAP (maintenance and administration position) to make it more consistent in layout and function with MAPs of other node types. This includes the format of information provided by MAP commands, such as QUERYPM. In addition it provides the ability to include or exclude a specific AP type node in the routine exercise (REX) test schedule, and to query the REX controller for data concerning the last REX test performed on the node.

BCS history

This feature was created in BCS36.

Feature interactions

This feature requires the following features in order to function:

- AL1117 Local RP Control II
- AL2030 System REX Test Controller
- AR0077 Application Processor MAP enhancements

This feature directly affects feature AL1115 (MAP for CM-based Resource Processors) by making changes to the AP MAP (maintenance and administration position) display.

User interface

The enhancements provided by this feature result in new information and new command responses to the MAP display. One option, TST<LONG/SHORT>, is removed. New responses are provided for BSY and TST REX <ON/OFF>, and additional information is output for QUERYPM and TST REX QUERY. Option TST REX NOW replaces the command TST REX.

AR0348

Feature name

Application Processor Mtce Support of AP BCS Applications

Description

This feature provides a means of installing a new software load on the applications processor (AP) while performing a cold switch of activity (SWACT). The node will go through an outage period while the process goes through the busy, SWACT, and return-to-service sequence.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature is applicable only to SYNC-matched peripherals, APs, and file processors (FP) that are based on the SYNC-matched duplex computing module (CM) hardware as defined in feature AL0963 (High Level Design for Multi-CM).

Restrictions and limitations

This feature provides only limited software protection for an AP against other types of maintenance when a cold SWACT is being executed. Some types of maintenance carried out during a cold SWACT can cause serious memory corruption, failure of the BCS application, or catastrophic failure of the node. Because of this risk, no other maintenance should be carried out during a cold SWACT software upgrade.

Feature interactions

This feature interacts with the following features:

- AL1974 Application Processor Split Mode
- AL1975 Application Processor Load Mate
- AL1111 Integrated Node Maintenance
- AL1195 Central RP Control II
- AL2131 MRS Enhancements
- AL1121 RP Link Maintenance

Logs

One new log, AP BCS application, is created by this feature. The log is generated when the AP BCS upgrade process is started and when it ends, and shows the success or failure of the process. If the process has failed, the log includes the reason for failure.

User interface

This feature introduces one new MAP command, BCSUpd. The command is available at the AP node level, and is used to start the AP BCS application process.

NTXF19AA

TCP/IP Protocols

This feature package provides central and node maintenance for the application processing unit with UNIX (APUX).

This feature package applies to DMS-100 offices.

AR0022

Feature name

IP Route Path Display

Description

This feature provides a tool for the display of the route taken by Internet Protocol (IP) datagrams transmitted from one SuperNode host to any destination that can be specified by its IP address.

BCS history

This feature was created in BCS36.

Restrictions and limitations

If two or more users try to employ the same source IP address then only one of them will be services and the rest will get a message saying that the tool server is busy. Note that if the server is actually executing a test at that time, it may not reply promptly causing the client to time out.

The user can not issue multiple requests. Given a pair of source and destination nodes the user has to wait for the tool to terminate and display all results before he can issue a new source/destination.

User Datagram Protocol (UDP) has to be present in every node that is used as a source node for sending IP datagrams.

There are two methods for tracing. The first, called Record Route (RR) can trace that path to-and-from a destination; however, only 9 IP addresses can be saved due to IP header size limitations. The second, called Time To Live (TTL) can trace the path to a destination. No upper bound on the number of IP addresses when using this method; however, it takes more time than using RR.

User interface

A command increment (IPRPDCI) provides the user interface for specifying the source and destination nodes, the number of IP datagrams to be sent and the information that the user wishes to see about all possible paths.

NTXF20AA

LPP on DMS-100 SuperNode for CCS7

This feature package enables the use of link peripheral processors (LPP) to terminate CCS7 signaling links on DMS SuperNode service switching point offices, and to enable the routine exercise test for the LPP.

This feature package applies to SuperNode and DMS-100 offices.

Feature package contents

Feature package NTFX20AA

Feature name

SRC Controlled Restart and No-Restart SWACT for CCS7

Description

This feature allows the system recovery controller (SRC) to control the recovery of Common Channel Signaling 7 (CCS7) links, linksets, routesets, and pools during warm, cold, and reload restarts, or during a no-restart switch of activity (SWACT).

BCS history

This feature was created in BCS36.

Restrictions and limitations

The no-restart SWACT for CCS7 offices is a function of office size, and certain configurations may not meet the target maximum of 30 seconds for complete switch recovery. Partial call processing will be available within the 30-s limit.

This feature does not support the CCS7 part of service control point I (SCPI) nodes.

This feature does not support the CCITT-based versions of signal connection control part (SCCP).

Feature interactions

This feature is one of four features that function together to allow CCS7, link peripheral processors (LPP), and ISDN user part (ISUP) to use the SRC for core restart recovery. The other features are as follows:

- AI0704 SRC Restart and No-Restart SWACT Support for SCCP and DDM
- AI0705 SRC Restart and No-Restart SWACT Support for LIMs and LIUs
- AR0467 SRC Restart and No-Restart SWACT Support for ISUP

AQ1030

Feature name

LPP (LMS) Autoloading

Description

This feature provides the local message switch (LMS) with the ability to recover automatically from loss or corruption of its software load.

During a system-busy recovery, the maintenance system automatically starts the reload of an LMS if there are indications that the software load is missing or has been corrupted.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The trigger for automatic reload of the LMS software is failure of the reset and restart sequence. If some other fault causes the reset and restart to fail, this feature will still initiate the reload sequence.

Logs

A log is generated when the recovery mechanism initiates a reload sequence. This separates system-initiated reloads from manually initiated reloads.

A log is also generated when the maintenance system reaches the threshold number of recovery attempts and stops. The log shows the number of failed recovery attempts, and indicates that manual action is required.

User interface

The MAP (maintenance and administration position) that has a given LMS posted displays a flag when that LMS is being automatically reloaded.

The maintenance flags displayed during an automatic reload are the same as those shown during a LOADPDM command.

The MAP displays a different flag (new for this feature) when the maintenance system is in periodic reload phase, or has stopped recovery. This flag tells maintenance personnel that manual action is required.

Feature name

Mapper Refresh on LMS State Transition

Description

This feature improves the robustness of the local message switch (LMS) recovery from the system-busy state.

BCS history

This feature was created in BCS36.

Feature interactions

This feature interacts with the frame transport system (FTS). Requests are made to the FTS, which then causes the message switch (MS) mapper to be re-initialized. This results in messaging traffic between the computing module (CM) and the MS.

Feature name

NT9X13DD Standalone Support in the LMS

Description

This feature provides the NT9X13DD card (processor with 16 Mbyte of DRAM) with optional memory card capability when it is used in the local message switch (LMS). The feature enhances both the central and local link interface module (LIM) software to support the NT9X13DD card as a standalone processor without a memory card.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature is invoked when the NT9X13DD processor card is configured without an accompanying memory card. If no memory card is provisioned, an NT9X19AA filler plate is inserted into either or both of slots 16 and 23 as required.

Restrictions and limitations

The new memory configurations available on the LMS require that new loads be built to access the added memory. There is currently no check to determine if the configured memory will support a given LMS software load.

Datafill

When a processor card is datafilled in table LIMCDINV, the memory card of the same LMS is allowed to be un-datafilled. However, a fault will be generated if an in-service memory card is not datafilled.

Command LOADPM will fail if a memory card is datafilled but is not physically present in the LMS.

NTXF25AD

Frame Relay Basic

This feature package creates a base software load for the development of the frame relay application in the frame relay interface unit (FRIU) located in the link peripheral processor (LPP).

This feature package applies to DMS-100 offices.

Feature name

ISDN 64-kbit/s Access to DataSPAN

Description

This feature provides ISDN customers with an alternative to the existing 56 kbit/s switched access to the frame relay network. This is achieved by setting up a permanent (nailed-up) connection, using a B-channel, through a T1 trunk that terminates on a frame relay interface unit (FRIU). In this way basic rate interface for both 56 kbit/s and 64 kbit/s is supported for the “nailed-up” B-channels through the network.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Running 64 kbit/s clear implicitly means that the A/B bit is not used to monitor connectivity. Users who wish to use 64 kbit/s must use the local management interface (LMI) to monitor connectivity.

SPECCONN connections can only be removed by manually deleting the tuple from table SPECCONN.

Primary rate access (PRI) B-channels cannot be “nailed-up” using SPECCONN.

AJ2946

Feature name

DataSPAN Congestion Control and Buffer Enhancements

Description

This feature provides customers with congestion control mechanisms to improve handling of congestion caused by momentary bursts of traffic. This enhances the quality of service to frame relay service (FRS) subscribers. It also provides tools to monitor the frame relay traffic on various components of the network.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Frame switching performance is reduced under the following conditions:

- when the congestion control procedures are activated
- with the use of egress random access memory (ERAM)
- with the use of tool QPLLC

Datafill

Table	Description
FRSCCTRL	New table, to allow configuration of congestion control parameters
PVDNAGEN	Two fields added, one for egress buffering utilization, the other as an index reference for the selected template in FRSCCTRL

Operational measurements

Group FRSAGENT is expanded to allow the capture of additional information on line utilization. Separate registers are provided for each channel.

The following counters are added to FRSAGENT:

- octrec Number of octets received
- octsent Number of octets transmitted
- fecnorig Number of times the frame relay interface unit (FRIU) sets the FECN bit on the channel
- becnorig Number of times the FRIU sets the BECN bit on the channel
- de1disc Number of frames discarded with DE = 1
- de0disc Number of frames discarded with DE = 0

User interface

Tool QPLLC is modified to capture information on each permanent virtual circuit (PVC) separately.

Subscriber Carrier Module-100 Access

This feature package provides a direct digital interface between the DMS SuperNode system and the S/DMS Access Node.

This feature package applies to DMS-100 offices.

AF2687

Feature name

RFT Event Handler

Description

This feature allows the DMS-100 switch to keep track of events occurring in remote fiber terminals (RFT). The event handler forms part of the operations gateway (OGW) in the DMS-100 switch and covers attribute changes and alarm reports.

BCS history

This feature was created in BCS36.

Feature interactions

In order to function properly, this feature needs to interact with the following features:

- AF2444 RDT External Alarm Interface
- AF2656 EOC Router
- AF2966 EOC Local Object Database

Feature name

Diagnostics for the EISP

Description

This feature integrates the enhanced ISDN signaling processor (EISP) into the subscriber carrier module-100 access (SMA) environment. The existing ISDN signaling processor (ISP) diagnostics are modified and new diagnostics are added to test new hardware functions. The feature also includes additional software to put the EISP into a known state under power-up or reset conditions.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature contains the firmware for the NTB01AB card (EISP).

Pack diagnostic specifics

The ROM diagnostics consist of the original ISP diagnostics modified to align with EISP functionality. An additional diagnostic test is provided to verify the operation of the write-protection circuitry.

The RAM diagnostics also consist of the original ISP diagnostics modified to align with EISP functionality.

Restrictions and limitations

The firmware developed for this feature is not compatible with the NTB01AA card (ISP).

AF3800

Feature name

SMA Dynamic Service Option Update I

Description

This feature provides additional software in the central control (CC). This ensures the proper setting of toll diversion (TDV) line termination object (LTO) attributes on POTS lines served by remote fiber terminals (RFT).

BCS history

This feature was created in BCS36.

Restrictions and limitations

All service provisioning for locally switched lines is carried out at the DMS-100 switch, using the table editor.

The DMS-100 table editor must be used to make any change to the TDV signal value in table OFCVAR.

Any change to the TDV or FD attributes must be made from the DMS-100 switch.

Lines with loopstart signaling support only the reversal type of TDV.

Feature interactions

This feature requires feature AF3801 (SMA Dynamic Service Option Update II) to send line object provisioning requests to the RFT line objects provisioning process.

This feature requires feature AF2614 (RFT Line Provisioning) to create and modify LTOs. When the embedded operations channel is not available, feature AF2614 is capable of handling LTO modification.

This feature requires feature AF2984 (RFT Line Provisioning Integrity) to monitor consistency of line provisioning data stored in the DMS-100 tables and in the RFT.

Feature name

SMA Dynamic Service Option Update II

Description

This feature provides the ability to handle remote digital terminal (RDT) lines that are in the “babbling” state. A “babbling line” is a line that exhibits incoming message overload conditions.

This feature also provides the following functions:

- Disabling of call processing when a “babbling line” is detected
- Enabling of call processing when the “babbling” fault is cleared

BCS history

This feature was created in BCS36.

Feature interactions

This feature affects feature AF2614 (RDT Line Provisioning). The time at which a line (and its associated line termination object) is put in service is changed.

Logs

The “babbling line” logs apply to RDT lines when this feature is active.

AF4438

Feature name

RFT Line Provisioning Extensions

Description

This feature enhances the robustness of remote fiber terminal (RFT) and remote digital terminal (RDT) line provisioning processes by the following means:

- simplifying the ISDN line provisioning process
- enhancing RDT objects audit, including ISDN line audit
- strengthening the situation management mechanism where provisioning of an already provisioned slot is attempted
- upgrading of log generation procedures and line provisioning log reports
- enhancing the RDT line state change mechanism

BCS history

This feature was created in BCS36.

Feature interactions

In order to function properly, this feature requires the following features:

- AF1618 Integrated Event Management
- AF2530 RFT Lines Table Control II
- AF2614 RFT Line Provisioning
- AF2655 EOC Protocol Stack I
- AF2656 EOC Router
- AF2727 EOC Protocol Stack II
- AF2966 EOC Local Object Database
- AF2984 RFT Line Audit
- AF3800 Dynamic Service Option Update I
- AF3801 Dynamic Service Option Update II

Feature name

Data Path Line Testing

Description

This feature implements the necessary software to provide line testing for data path units. The testing will be performed from levels ALT, LTP, and LTPDATA of the maintenance and administration position (MAP).

BCS history

This feature was created in BCS36.

User interface

This feature is accessible from levels ALT, LTP, and LTPDATA of the MAP. Command DIAG is accessible from levels ALT and LTP of the MAP.

Command SDIAG is available only from level ALT. Option LC is available through level LTP. This option is equivalent to command SDIAG in level ALT.

Commands EQUIP, LOOPBK, and CONNECT are available for basic error rate testing (BERT) at the LTPDATA level.

NTXF46AA

AF4979

Feature name

SMA ISDN Line Test Object I/F

Description

This feature AF4979 SMA ISDN Line Test Object I/F completes the work started by the feature AF2968, RTF Line Test Position III, in BCS34 to support maintenance of Integrated Services Digital Network (ISDN) lines equipped on S/DMS AccessNode.

BCS history

This feature was created in BCS36.

Feature name

OPC and NE Identification at the DMS

Description

This feature simplifies the process of locating the source of a remote digital terminal (RDT) alarm. It accomplishes this by providing the following information in DMS displays of RDT alarms:

- RDT network element identifier (NE ID)
- RDT network element name (NE NAME)
- Primary operations controller identifier (primary OPC ID)
- Backup operations controller identifier (backup OPC ID)

BCS history

This feature was created in BCS36.

Restrictions and limitations

Operations controller (OPC) ID cannot be propagated to the DMS switch automatically. Manual provisioning of fields PRIMOPC and BACKOPC of table RDTINV is necessary.

Feature interactions

This feature modifies the output from the following features:

- AF3798 SMA RFT Alarm Report Handler
- AF4439 SMA RFT Event Handler Enhancements

Datafill

Table	Description
RDTINV	Field SID renamed to NENAME
RDTINV	Fields PRIMOPC and BACKOPC added

Logs

This feature modifies the following DMS logs:

- RDT301
- RDT302
- RDT303
- RDT304
- RDT305

NTXF46AA

AF5330

For each of the above logs the NE ID, NE NAME, primary OPC ID and backup OPC ID are added within the body of the log entry. Field PROCEDURE is added to supplement field ACTION.

User interface

This feature modifies the following command interpreter (CI) functions:

- Command QueryPM at the IDT level of MAPCI
- Command RDTalarm at the IDT level of MAPCI

For each of the above commands the NE ID, NE NAME, primary OPC ID and backup OPC ID are added to the output.

Feature name

SMA Dynamic Static Data Update

Description

This feature allows the extended multiprocessor system (XMS)-based peripheral module (XPM) and the central control (CC) to send a subset of static data to in-service subscriber carrier module-100 access (SMA) units automatically when the data is changed. This eliminates the need to busy the SMA, allowing service to be maintained to those integrated digital terminals (IDT) that are not directly affected by the changes.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Existing engineering rules governing the reconfiguration of an SMA, its links and associated nodes, still apply.

If an SMA is in an in-service trouble (ISTB) state with a static data mismatch, and an associated static data table is dynamically changed, the static data is dynamically updated. However, since the original reason for going ISTB is not remedied by the data changes, the SMA remains in an ISTB state.

If any ISDN lines are datafilled for a remote digital terminal (RDT), existing links from the SMA to that RDT cannot be deleted or reconfigured. New links can be added.

Datafill

Table	Description
RDTINV	Fields CLAPDPAR, EOC, ELAPDPAR, and LINKTAB modified

NTXF46AA

AN0230

Feature name

SMA Enhanced Time-Switch I

Description

This feature provides the modifications necessary to incorporate the NTAX78AA card (digital cellular time-switch) into the subscriber carrier module-100 access (SMA).

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the SMA to be equipped with an NT6X44CA card.

Datafill

Table	Description
LTCINV	DCTAX78 (the OPTCARD code for the NTAX78) is listed as a valid OPTCARD for the SMA

Feature name

IRTU Provisioning

Description

This feature provides all data dictionary and table control changes required for the addition of the integrated remote test unit (IRTU) card S/DMS AccessNode.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Maintenance and administration position (MAP) testing is provided only by test bypass pair (TBP).

An external remote test unit (ERTU) and an IRTU cannot be provisioned on the same AccessNode. IRTU or ERTU can be provisioned with the TBP or provisioned individually as ERTU or IRTU.

The ERTU or IRTU is always a No-test Trunk (NTT) test head user.

If an ERTU or IRTU and a TBP are provisioned, the the ERTU or IRTU will be used as a NTT.

Feature interactions

This feature requires AN07 in the AccessNode.

Datafill

Table	Description
RDTINV	Value IRTU added to field MTSTACPT

Service orders

Additional inputs required to allow provisioning of the IRTU.

AN0453

Feature name

SMA CM XPM Robustness Program

Description

This feature adds the Subscriber Module Access (SMA) to the group of extended peripheral modules (XPM) supported by the enhanced computing module (CM) resident XPM maintenance services. These services are provided for:

- a CM resident base to record selected diagnostic results from XPMs
- an improved switch of activity (SWACT) controller for the control of XPM SWACTs
- an improved control and trouble notification mechanism for XPM Routine Exercise (REX) failures.

BCS history

This feature was created in BCS36.

Logs

Log PM600 allows the suppression of multiple logs during REX (a REX pass produces 3 logs instead of 17; a REX failed produces 3 logs instead of up to 32 logs).

User interface

A new option is added to command DISP at the PM level of the MAP terminal. This option displays the diagnostic history data (as shown below) for all XPMs in the office or for all XPMs of a given PM type.

```
Disp <Option> {state<state>{SysB, ManB, Offl, CBSy, ISTb, InSv},  
              DiagHist}  
              [pmtypel
```

Command QUERYPM, at the directory of a posted PM, is enhanced to display the diagnostic history data (shown below).

```
QUERYPM [<option> {Flt,  
                  Cntrs,  
                  DiagHist [<diag> {DIAG},  
                             <card> {CARD),  
                             <reset> {RESET}}}]
```

Option DIAGHIST is added to command QUERYPM to allow the following actions:

- The default action displays the failed diagnostics and associated cards.
- Option DIAG displays the summary of diagnostic failures counts.

- Option **CARD** displays the summary of the cards reported as hardware failures.
- Option **RESET** resets the LTF counters to zero and displays log PM601 with a summary of the counters prior to the reset.

ILM Isolation Detection Enhancements

Description

This feature provides enhancements to the isolation detection function (IDF) that allows it to provide full support for the following nodes:

- application processor (AP)
- file processor (FP)
- link interface unit (LIU)
- network interface unit (NIU)

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature applies only to the nodes listed in the description paragraph, above.

Feature interactions

This feature requires the provision of feature AL1740 (ILM Notification Enhancements) in order to function properly.

Feature name

Cache Statistics OMS

Description

This feature defines and implements the definition and the collection of Operational Measurements (OMs) for the Cache Manager system that provides memory buffering of data that are stored on disk for NPP management services.

This feature implements two types of OMs:

- Application-independent OMs which are collected and reported through the OM system by the cache manager on a single cache. The application independent OMs on each File Processor (FP) node are collected and provided to the DMS central OM system. The new OMs which are implemented by this activity are bound to the existing DMS OM system. Analysis and reporting of the Cache OMs are also handled through the existing DMS OM System mechanisms
- Application-dependent OMs which are bound to an application on request. This feature also implements an interface to be used by the Transactional Record Management System (TRMS) applications to bind OM data to its registers on request.

BCS history

This feature was created in BCS36.

Feature interactions

This feature (AR0317) provides a cache OMs data that is required by performance oriented applications.

AR0317 uses systems services provided under the following features:

- AD1605 Distribute OM System Design

Datafill

There are no new data scheme for this feature. However, it uses existing table control parameter.

The OM collection interval is configured using table control according to standard DMS practices. The collection intervals may be 5, 15 or 30 minutes. (see NTP 298-1001-451 'DMS-100 Family Common Customer Data Schema).

The Distributed OM system is configured by using table control OFCNG office parameter DISTRIBUTION.

Operational measurements

Cache Oms are collected for each cache. The name chosen for this OM group is “CACHEMGR”. There is no key identified for this group because it can not be uniquely predefined. The info field contains the cache name which is assigned dynamically at run time by the application when the cache is allocated. One cache is assigned for each OM tuple. Only tuples for allocated caches are reported.

When a cache is deallocated, its associated tuple is suppressed, the data for the interval during which this cache is being deleted is not reported. Also, if a cache is deallocated as a side effect of operations, such as closing the database than reopening it, will cause the OM system to assign a new tuple rather than suing existing tuple because the Cache Manager does not keep information to indicate that the same cache is reallocated.

The counters from the memory reads and writes contains data for operations which are done in memory without access to disk. For example, the DISKREAD counter is only incremented for a read operation which requires to get data from disk.

The following is a list of counts for each cache instance. Note that the counts listed below require two registers each since the OM count may exceed the capacity of a single register. Counts listed below peg operations for cache pages at the Cache Manager level because the cache manager provides paged view of the disk.

- MEMREAD Number of successful memory read operations to the cache bound to this OM (i.e. the number of pages read from the cache without accessing the disk).
- MEMREAD2 The extension register of MEM READ
- DISKREAD Number of successful disk read operations by the caches bound to this OM (i.e. the number of pages read into the caches from disk).
- DISKREAD2 The extension register of DISKREAD
- DISKREAD Number of successful memory write operations to the caches bound to this OM (i.e. the number of pages written from the cache without accessing the disk).
- MEMWRIT Number of successful memory write operations to the caches bound to this OM (i.e. the number of pages written from the cache without accessing the disk).
- MEMWRIT2 The extension register of MEMWRIT
- DISKWRIT Number of successful disk write operations to the caches bound to this OM (i.e. the number of pages written to disk).
- DISKWRIT2 The extension register of DISKWRIT

User interface

Standard DMS procedures are used to view TRMS OMs once they are captured in the central DMS OM system. Log reports of TRMS defined events are also accessed through standard DMS man-machine interface for logs.

CLASS Visual Message Waiting Indicator

This feature package provides a visual indication that messages are waiting for customers who forward their telephones to a Voice Message Service (VMS) provider. A VMS provider allows customers to both leave and receive voice messages.

This feature package applies to DMS-100 offices.

NC0499

Feature name

CMWI Enhancements for Universal Digital Loop Carriers

Description

This feature allows CLASS Messaging Waiting Indicator) CMWI to function on lines which physically exist on the Universal Digital Loop Carriers (UDLCs). CMWI requires a path to be established from the switch to the line. For lines which are on a UDLC, a path is not established on a terminating call until physical ringing is detected at the UDLC. This feature provides a half second of ringing prior to activating or deactivating the MWI (Messaging Waiting Indicator) to establish the path to the customer premise equipment (CPE). This functionality is provided by table control on a per line basis, as part of the MWT line option.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The same restrictions that apply to CMWI apply to this feature. It is not supported in feature groups. It is not supported on KSETs.

Currently, ringing does not occur with audit functionality. This feature does not provide ringing capability with audits.

Feature interactions

Lines with this feature will be considered busy from the start of the ring splash until the message to activate/deactivate the MWI has been sent. Attempts to terminate to these lines at this time will receive busy treatment.

Datafill

Table	Description
IBNFEAT	changes in field CMWIRING

This field indicates whether ringing should precede messages to activate or deactivate the MWI. Prior to this feature, the range of values for this field was 'N' or 'Y'. 'N' indicates that ringing should not precede activation or deactivation. 'Y' indicates that ringing should precede activation only. New value, 'UDLC' indicates that ringing should precede activation and deactivation. Under new value 'UDLC' the IRN field associated with CRN cannot be set of OFFHOOK. This is due to the fact that ringing must always accompany a msg to the set, not just when the user had been offhook.

Service orders

This feature allows field CMWIRING of the line option MWT, to have a value of 'UDLC'.

NTXJ51AA

ISDN Digital Test Access

This feature package allows ISDN basic rate B-channels and D-channels to be monitored with a commercially available protocol analyzer.

This feature package applies to DMS-100 offices.

AF4839

Feature name

RSC-S Digital Test Access

Description

This feature provides the ability to monitor B and D channels on the remote switching center SONET (RSC-S) from an external protocol analyzer at the central office. The feature also allows service access point identifier (SAPI) users to select terminal endpoint identifiers for terminals on the RSC-S platform. The link access procedure on the D-channel (LAPD) is verified by this feature for compliance with Bellcore technical reference TR-TSY-000793, *ISDN D-Channel Exchange Access Signaling and Switching Requirements (Layer 2)*.

BCS history

This feature was created in BCS36.

Hardware requirements

The monitored data streams obtained by digital test access (DTA) must be directed toward either an ISDN line card, or a DS-1 trunk. If a DS-1 trunk is used, it must be provisioned for 64-kbit/s data transmission.

Restrictions and limitations

B sub-D channel (Bd) connections that terminate at the DMS packet handler cannot be monitored.

The number of DTA connections active in the office is limited by office parameter MAX_DTA_ON_SWITCH in table OFCENG.

The maximum number of simultaneous DTA connections allowed for each extended multiprocessor system (XMS)-based peripheral module (XPM) is six.

DTA allocates channels on the links between the loop monitoring point and the monitoring equipment. It also makes connections across peripheral and network modules between those channels. While the DTA is active, these channels are unavailable for call processing.

DTA connections are downloaded as part of the XPM static data. Care should, therefore, be taken when adding or removing DTA connections when either unit of the CPM remote cluster controller (RCC2) is out of service, or in emergency stand-alone (ESA) mode. Changes to DTA connections during these circumstances will require static data to be downloaded in its entirety, possibly increasing return-to-service (RTS) time.

Feature interactions

When DTA connections are active on lines connected to an enhanced line concentrator module (LCME), feature AF4841 (RSC-S LCME Link Rearrangement) must not be used.

User interface

The EQUIP command at the LTPDATA level of the MAP (maintenance and administration position) is modified to allow DS-1 endpoints on an RCC2 to be defined as DTA monitor points.

SMDI Private CLID Suppression

This feature package prevents restricted directory numbers from being forwarded over a simplified message desk interface (SMDI) to an enhanced service provider (ESP). The feature supports both nodal and Common Channel Signaling 7 (CCS7) networked calls, and is typically used for connection to voice mail systems.

This feature package applies to DMS-100 offices.

NTX901AA	Local Features I

AF3679

Feature name

SMDI Calling DN Delivery Optionality

Description

On intra-group calls, this feature allows the calling and forwarding directory numbers (DN) to be delivered to a simplified message desk interface (SMDI).

BCS history

This feature was created in BCS36.

Restrictions and limitations

Residential Enhanced Services (RES) lines will not pass intra-group checking for this feature.

If Integrated Business Network (IBN) ISDN user part (ISUP) trunking is used, and both business group (BG) and network information (NETINFO) parameters are passed in the initial address message (IAM), the BG parameter takes precedence in determining the customer group.

Option SMDICND allows the operating company to deliver or block a DN on the basis of the customer groups of the agents involved in the call. If this option is active, an ISUP call where both the calling and forwarding parties are on another node will not pass the intra-group criteria check.

If it is not possible to determine the customer groups involved in a call, the call is not considered an intra-group call.

The SMDICND option is incompatible with bridged night number (BNN), call pickup (CPU), multiple position hunt (MPH), or preferential hunt (PRH) types of hunt groups.

The customer group associated with a virtual facility group (VFG) that has been spanned within a call will not be recognized by the intra-group determination process. The only exception to this is ISUP originations that include multilocation business group (MBG) or NETINFO parameters.

Datafill

Table	Description
SLLNKDEV	Option DNSUPPR, field CALLING, value NODIRECT added
UCDGRP	Option SMDICND added
HUNTGRP	Option SMDICND added

Service orders

Option SMDICND added for hunt groups. The option can be added using table control or the Service Order System, SERVORD. SERVORD is recommended.

NTXN75AA

Remote Call Forward without Unique PIN

This feature package allows call forward remote access (CFRA) personal identification numbers (PIN) to be non-unique. This feature package introduces station-programmable PINs, which allow subscribers to change their PIN numbers from their own telephones, using a feature access code.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXN75AA

NC0192

Feature name

Remote Call Forwarding Without Unique PIN

Description

NC0192 provides call forwarding-remote access (CFRA) with personal identification numbers (PIN) that are not necessarily unique to each subscriber line. This feature also provides Station Programmable PINs (SPP). An SPP allows a subscriber to use their own telephone to change a PIN, using a feature access code.

BCS history

This feature was created in BCS33.

BCS36 Changed

Hardware requirements

This feature requires a digital recorded announcement machine (DRAM) with a controller card (version 1X75BA), the CFRA PROM card (version 1X76AM), and either an auxiliary operator services system voice response unit (AOSS/VRU) English announcements card (version 1X76AG), or a CLASS phase I English announcements card (version 1X76AK).

Restrictions and limitations

The recorded phrase must be stored on a DRAM memory card located in the same maintenance trunk module (MTM) as the CFRA PROM card (version 1X76AM).

SPP users are not allowed to enter a new PIN that equals the old PIN.

SPP users must wait for announcement prompts to enter digits for PIN feature access codes

The following announcements disallow digit entry

- PIN feature prompt announcement: CALL FORWARD REMOTE ACCESS
- incorrect PIN announcement: YOU HAVE ENTERED AN INCORRECT PIN
- exceeded retries announcement: YOU HAVE EXCEEDED THE RETRY COUNT
- CFRA first announcement: YOU MUST FIRST CHANGE YOUR PIN BEFORE USING THIS FEATURE. THE PIN CHANGE MUST BE PERFORMED FROM YOUR OWN PHONE

Only basic rate access Meridian feature transparency (BRAMFT) ISDN sets are supported by this feature. Attempts to use other ISDN set types for SPP or CFRA result in a feature not allowed (FNAL) treatment.

BRAMFT ISDN sets can add CFRA by service orders only. All other ISDN sets are incompatible

Activation of SPP from a second multi-appearance directory number (MADN) is not allowed.

Bridging is not allowed from the second leg of a three-way call (3WC), or during CNF calls.

Multiline hunt (MLH) and distributed line hunt (DLH) hunt group members cannot use SPP. These hunt groups allow CFRA to be assigned to the pilot only.

Call waiting (CWT) and call waiting intragroup (CWI) are disallowed during SPP or CFRA.

Only primary MADNs or single line appearance directory numbers (DN) can have call forward universal (CFU), call forward fixed (CFF), or call forward intragroup (CFI).

A minimum value of 3 is recommended for the PINRETRY field in table CUSTSTN for the CFRA option.

Datafill

Table	Description
CUSTSTN	SPP added to the range of values for field OPTNAME
	SPP added to the range of values for field OPTION
	Range 1 to 3 in field RETRIES available for use with fields OPTNAME and OPTION
IBNXLA	SPP added to the range of values for field FEATURE to datafill the SPP access code
ANNS	SPP added to the range of values for field FEATURE to datafill the SPP access code
-continued-	

Table	Description
DRMUSERS	SPPANNC1, SPPANNC2, SPPANNC3, SPPANNC4, SPPANNC5, SPPANNC16, SPPANNC7, SPPANNC8, and CFRAFRST added to the range of values of field PHRASELIST to datafill the phrase names for SPP custom announcements
End	

Office parameter SPP_MAX_PROGRAMMERS is added to table OFCENG to specify the maximum number of users that can be simultaneously performing a change using the SPP function.

This feature increases program store by a maximum of 9 Kbytes and increases data store by a maximum of 120 Kbytes.

Service orders

If a package change or update is implemented, this feature will rename the PIN prompt from AUTHCODE to CFRAPIN during service order commands ADO, NEW, or CHF.

Operational measurements

This feature adds the operational measurements (OM) group SSPN. This group consists of the registers SPPSUCC, SPPNOMAT, SPPNOVER, SPPRETRY, SPPLIMEX, and SPPPROG.

Register SPPSUCC is incremented each time a subscriber successfully changes a PIN with the SPP feature.

Register SPPNOMAT is incremented each time a PIN and a DN do not match.

Register SPPNOVER is incremented each time a new PIN entry fails verification.

Register SPPLIMEX is incremented each time a caller exceeds the retry count during an SPP attempt.

Register SPPPROG is incremented each time the number of simultaneous SPPs used exceeds the office parameter SPP_MAX_PROGRAMMERS.

Logs

This feature adds log IBN136, which is generated each time an SPP user exceeds the retry count during any part of the SPP function.

LIS Common-LMS Functionality on MS

This feature package provides the frame transport bus (F-bus) user interface support for the Mininode. It also provides generic F-bus maintenance support for a variable number of link interface unit (LIU) shelves.

This feature package applies to DMS-100 offices.

AR0478

Feature name

F-Bus Operation and Maintenance Enhancements

Description

This feature streamlines the DMS-bus F-bus operations and interactions and provides enhancements in the following areas:

- Restart initialization
- No restart switch of activity (SWACT)
- Log output
- Combination of the rate adaptor F-bus and single-shelf link peripheral processor (SSLPP) on the SuperNode SE (SNSE) DMS-bus
- Simplified reconfiguration of the bandwidth of the supporting interface card pair for the SSLPP

BCS history

This feature was created in BCS36.

Restrictions and limitations

The changes made in this feature apply only to DMS-bus and supported application service units (ASU).

Feature interactions

The software provided by this feature structures the interactions between F-bus and ASUs.

NTXN87AA

Integrated Testing Base

This feature package modifies line maintenance utilities to allow them to be used by both the existing line maintenance and by ISDN TL1 line maintenance.

This feature package applies to DMS-100 offices.

NTX901AA	Local Features I

AF4838

Feature name

RSC-S Enhanced Line Testing I

Description

Maintenance for ISDN two binary, one quaternary (2B1Q) loops and lines consists of controlling their state, and accessing, monitoring, testing, and requesting information concerning them. The purpose of this feature is to provide the same functionality for ISDN 2B1Q loops connected to enhanced line concentrator modules (ELCM) that are attached to ISDN common peripheral module (CPM) compact remote cluster controller units (RCC2), or to ISDN remote switching center offshore 2 units (RCO2).

BCS history

This feature was created in BCS36.

Hardware requirements

The 1X89AA/AB card (multiprotocol controller) is required for the multiprotocol controller (MPC).

The test network terminator 1 is a standard NT1 unit, such as the NTB80AA unit (2B1Q NT1 test box).

An NT0J42BA test box (enhanced services test unit) serves as the ESTU master module.

The loop emulator must be capable of simulating 3 960 m (13 000 ft) of 26-gauge wire at 300-kHz bandwidth.

The digital modem (DMODEM) consists of the following two circuit packs:

- NT3X02AA Modem circuit pack
- NT3X03AA D modem circuit pack

A line circuit (LC) is wired to the ESTU dedicated modem port. The LC must be a ground start circuit, such as the NT6X18AB card (line card type B with +48 V).

The ISDN 2B1Q LC is the NTB27AA card (2B1Q U-interface ISDN line card). This must be release 0D07 in order to carry out layer-1 performance monitoring and testing.

Restrictions and limitations

The limitations and restrictions that apply to the ISDN 2B1Q loops and lines connected to ELCMs that are attached to an ISDN trunk controller or ISDN line group controller also apply to this feature.

NTXN87AB

Integrated Testing Base

This feature package modifies line maintenance utilities to allow them to be used by both the existing line maintenance and by ISDN TL1 line maintenance. This feature is an upgrade to feature NTXN87AA.

This feature package applies to DMS-100 offices.

- NT3X03AA Dmodem circuit pack

A line circuit (LC) is wired to the ESTU dedicated modem port. The LC must be a ground start circuit, such as the NT6X18AB card (line card type B with +48 V).

The ISDN 2B1Q LC is the NTB27AA card (2B1Q U-interface ISDN line card). This must be release 0D07 in order to carry out layer-1 performance monitoring and testing.

Restrictions and limitations

The limitations and restrictions that apply to the ISDN 2B1Q loops and lines connected to ELCMs that are attached to an ISDN trunk controller or ISDN line group controller also apply to this feature.

ISDN Integrated Packet Handler

This feature package provides the DMS packet handler (DMS-PH) application on the link peripheral processor (LPP).

This feature package applies to SuperNode offices with ISDN.

AL2200

Feature name

DMS PH Line Maintenance Interactions

Description

AL2200 provides ISDN line maintenance support for the DMS packet handler (DMS-PH). This feature also provides maintenance and test capabilities for nailed-up B-channel (Bb) connections to the DMS-PH.

BCS history

This feature was created in BCS34.

BCS35 Changed

BCS36 Changed

Restrictions and limitations

This feature applies to the following card types only:

- NTB25AB (ISDN U-line card)
- NTB26AA (ISDN S/T line card)
- NTB27AA (2B1Q U-interface ISDN line card)

Feature interactions

This feature interacts with the following features:

- AJ1837 DMS-PH Data Distribution-CM
- AL2025 DMS-PH Call Processing Base
- AL2195 DMS-PH Bd Channel Maintenance
- AL2326 SPECCONN for the DMS-PH
- AQ0845 DMS-PH Call Processing II
- AQ0852 DMS-PH PVC Call Processing

Datafill

This feature increases program store by a maximum of 10 kbytes and increases data store by a maximum of 3 kbytes.

User interface

This feature modifies commands BSY, FRLS, CKTLOC, DIAG, POST, and RTS at the LTP level of a MAP terminal.

Command CKTLOC is modified to display additional information when a B-channel of an ISDN line is posted.

Command DIAG is modified to perform a Bb-channel continuity test as part of the full diagnostics.

Commands BSY and FRLS are modified so that Bb-channels connected to the DMS-PH are brought out of service when an ISDN line is set to manual-busy (MANBSY). Command BSY is also modified to disallow the busy state if the Bb-channel has a permanent virtual circuit (PVC).

Command RTS is modified to return nailed-up B-channels to service.

This feature adds command BCHCON to the LTPISDN level of a MAP terminal. Command BCHCON performs Bb-channel continuity tests on nailed-up B-channels connected to the DMS-PH on a posted ISDN line card.

AL2440

Feature name

DMS-PH Query Commands

Description

AL2440 provides a set of query commands for the DMS packet handler (DMS-PH). This feature modifies existing ISDN query commands and adds commands specific to the DMS-PH.

BCS history

This feature was created in BCS34.

BCS36 Changed

Restrictions and limitations

The associated X.25/X.75 link interface unit (XLIU) must be in service for command QCOUNTS to function correctly.

Feature interactions

This feature interacts with the following features:

- AL2195-DMS-PH Bd Channel Maintenance
- AL2061-HFP Maintenance and Performance Enhancements
- AL2066-X.25, X.75 Service I/F to Provisioning
- AL2125-Packet Terminal Provisioning
- AL2126-X.75 Trunk Data
- AL2127-X.75 Basic and Supplementary Service Datafill
- AL2291-X.25 Basic Service Provisioning
- AJ1833-X.75 Service Assignment
- AJ1836-DMS-PH PVCs/CUGs Provisioning
- AL2326-SPECCONN for the DMS-PH
- AL2438-DMS-PH Channel and Link Maintenance

User interface

This feature modifies MAP commands QDCH, QIT, QBB, and QSCONN at the DMSCI level.

Command QDCH is modified to display Bd channels for the DMS-PH that are mapped to an X.25 services group (XSG) endpoint in table SPECCONN.

Command QIT is modified to display a message when the queried logical terminal identifier (LTID) is provisioned for DMS-PH.

Command QBB is modified to display Bd channels mapped to an XSG channel.

Command QSCONN is modified to display special connections on a particular XSG.

This feature modifies command QLOOP at the LTPISDN level of a MAP terminal.

Command QLOOP is modified to display LTIDs, directory numbers (DN), and terminal endpoint identifiers (TEI) on a posted ISDN loop.

This feature adds commands QCOUNTS and QPHF to the DMSCI level of a MAP terminal.

Command QCOUNTS displays link level counts and packet level counts for X.25 terminals or X.75/X.75' trunks connected to the DMS-PH.

Command QPHF displays information on how the DMS-PH is configured and what service data is associated with each XLIU.

ISDN Integrated Packet Handler

AQ1008

Feature name

Telco Settable Defaults

Description

This feature allows operating companies to define defaults for the DMS Packet Handler X.25 service parameters.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The following restrictions apply to this feature:

- The feature only affects parameters in tables DNCTINFO and DNCHNL
- This feature does not apply to defaults for permanent virtual circuit (PVC) and closed user group (CUG) information
- The default values for parameters NDWS, NDPS, and DTCA must be changed in order to be able to change the default values for window size, packet size, and throughput size.
- Only one set of defaults exists for parameters DNCTINFO and DNCHNL
- When changing defaults in table SVCDATA, only subsequent SERVORD NEW commands will be affected. Existing datafill is not modified.
- The default values for parameters CUGS and NUI in table DNCTINFO cannot be changed in table SVCDATA

Feature interactions

With this feature, the defaults for tables DNCTINFO and DNCHNL can be modified by changing the appropriate tuples in table SVCDATA. Once the defaults are modified in table SVCDATA, and SERVORD is used, the defaults in DNCTINFO and DNCHNL will be the changed defaults.

Datafill

Table	Description
SVCDATA	Fields FSA, RCA, ICS, TCN, FCPN, OCB, ICB, LCP, RPOAB, LLFSQ, LLWS, I1, T2, T3, N2, LCA, SLCN, NPVC, NOWI, NOWO, NNRC, PLSQ, NDWS, NDPS, IMPS, OMPS, DTCA, ODTCA, IDTCA added

Feature name

PVC Type II Billing

Description

This feature provides the capability of permanent virtual circuit (PVC) type II billing for DMS packet handler (DMS-PH) call processing.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature is supported only on SuperNode ISDN switches.

Restrictions and limitations

This feature is supported only on SuperNode offices.

The SERVORD interface does not support the setting of PVC type II billing in table PVCINFO, subfields ADDRfmt, CHRgDN, and CHNLTY, or table BILLSEL, field CHRgDN, subfield LCN.

This feature checks the chargeable directory number (DN) provided for length and for leading zeros. For an E.164 format the feature verifies that the number of digits is 4-14. For an X.121 format the range is 5-14. A valid DN begins with either a country code or a data network identifier code (DNIC). Neither of these codes have zero as the first digit, so DNs with leading zeros are not accepted.

Billing cannot be enabled for an X.75 master.

Feature interactions

This feature builds upon the capabilities provided by the following two features:

- AG2343 DMS-PH Billing Base
- AQ0852 DMS-PH PVC Call Processing

Datafill

Table	Description
PVCINFO	Field BILLSEL, value CHRgDN added
BILLSEL	Field CHRgDN added

Automatic message accounting

This feature provides type II billing facilities for PVC calls.

NTXP55AA

Dynamically Controlled Routing (DCR/LDR)

AJ2446

Feature name

LDR: MNA Base

Description

This feature is part of a set of features that together enhance the dynamically controlled routing (DCR) within the DMS system. This enhancement permits the DMS switch to handle multiple network access (MNA), allowing a single DMS node to be part of both the local network and the toll network.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The network name must be no more than 12 characters long. The abbreviated network name must be no more than 4 characters long.

Feature interactions

The existing DCR software is enhanced to handle local dynamic routing (LDR) and MNA.

Operational measurements

This feature changes the software so that the network name is the key to access the peg count registers for the DCRMISC operational measurements (OM) group.

The key to the DCRDEST and DCRLINK OM groups is changed from the destination node name to NETNAME\$DEST_NODE_NAME.

In order to display the peg counts of the OM group registers using the OMSHOW command, both the network name and the node name must be entered with the special \$ character.

Logs

This feature adds the DCR network name field to the following logs:

- DCR100
- DCR101
- DCR102
- DCR103
- DCR104

User interface

This feature modifies the syntax of DCRMUCH MAPCI command in the network management. MAPCI level is modified and DCRSEL command is added in the level as command 11.

NTXP55AB

Dynamically Controlled Routing (DCR/LD)

This feature package contains features that support dynamically controlled routing (DCR) within the DMS switch and implement multiple network access (MNA), allowing a single DMS node to be part of both the local network and the toll network.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTP55AB contents

NTX901AA	Local Features I
NTXE65AA	MPC X.25 Interface

AJ2446

Feature name

LDR: MNA Base

Description

This feature is part of a set of features that together enhance the dynamically controlled routing (DCR) within the DMS system. This enhancement permits the DMS switch to handle multiple network access (MNA), allowing a single DMS node to be part of both the local network and the toll network.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The network name must be no more than 12 characters long. The abbreviated network name must be no more than 4 characters long.

Feature interactions

The existing DCR software is enhanced to handle local dynamic routing (LDR) and MNA.

Operational measurements

This feature changes the software so that the network name is the key to access the peg count registers for the DCRMISC operational measurements (OM) group.

The key to the DCRDEST and DCRLINK OM groups is changed from the destination node name to NETNAME\$DEST_NODE_NAME.

In order to display the peg counts of the OM group registers using the OMSHOW command, both the network name and the node name must be entered with the special \$ character.

Logs

This feature adds the DCR network name field to the following logs:

- DCR100
- DCR101
- DCR102
- DCR103
- DCR104

User interface

This feature modifies the syntax of DCRMUCH MAPCI command in the network management. MAPCI level is modified and DCRSEL command is added in the level as command 11.

Feature name

DCR: MNA Table Control

Description

This feature modifies table control as part of a group of changes that collectively implement the multiple network access (MNA) capability.

BCS history

This feature was created in BCS36.

Restrictions and limitations

A dynamically controlled routing (DCR) trunk group must belong to one network only.

Feature interactions

This feature builds upon the base provided by feature AJ2446 (LDR: MNA Base). It also interacts with the following two features to implement MNA capability:

- AJ2885 DCR: MNA Activation
- AJ2886 DCR: Base RO Modifications

Datafill

Table	Description
DCRNETID	New table, containing network name, short network name, network type, and operation mode status for each network
DESTKEY	Field NETLIST added to record the networks to which the destination belongs
DESTNODE	Field NETNAME added
DCROPT	This table no longer contains tuples. The information is now contained in table DCRNETID
TKTONODE	Field NETNAME added
OFRT	Field added for DCR network name
RTEREF	Field added for DCR network name

This feature also removes control of the size of table DESTNODE from field SIZE in table SYSDATA.

AJ2886

Feature name

DCR: Base RO Modifications

Description

This feature makes changes to the remote operation (RO) communications messaging between the DMS switch and the network processor (NP). It is part of a group of changes that collectively implement the multiple network access (MNA) capability. It extends the dynamically controlled routing (DCR) services to include both the local and the toll networks.

BCS history

This feature was created in BCS36.

Feature interactions

This feature builds upon the base provided by feature AJ2446 (LDR: MNA Base). It also interacts with the following two features to implement MNA capability:

- AJ2610 NP MNA Preparation
- AJ2884 DCR: MNA Table Control

Logs

Log DCR 105 has six new reasons added to cover the extra invalid arguments that can be generated.

Log DCR 107 has one additional value added to field DCRINFO to allow identification of inconsistencies in the MNA mode values.

NTXP92AB

Feature name

Real-Time Performance of MX73 and MX76 Packs

Description

This feature provides maintenance personnel with real-time performance information about the NTMX73AA card (PCM signaling pack) and the NTMX76AA card (HDLC/DMSX messaging interface). The data will reflect real-time usage within each processor.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the NTMX73 card and the NTMX76AA card.

Restrictions and limitations

The NTMX73AA card is used only in the remote switching center-SONET (RSC-S), and therefore the NTMX73AA real-time performance is supported only for the domestic (compact remote cluster controller [RCC2]) and the international (remote switching center offshore 2 [RCO2]) peripherals.

Logs

Two data fields are added to logs PRFM200. These fields reflect the additional information concerning the NTMX73AA card and the NTMX76AA card. The logs are printed every 15 minutes, or as requested.

User interface

At the PMACT sub-level of the MAP (maintenance and administration position) a new line is inserted. This contains information relative to the NTMX73AA card and the NTMX76AA card.

This feature package restructures the Automated Alternate Billing Service (AABS) cross-processor code in preparation for the addition of Automated Directory Assistance Service (ADAS).

This feature package applies to DMS-100 offices.

AN0327

Feature name

ADAS APU Software Installation (Phase II)

Description

This feature provides the ADAS-specific components for software installation on the application processor unit (APU).

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of two cards: NTEX22BA (integrated processor and F-bus interface card) and NT9X14DB (24-Mbyte memory card). These cards together make up the APU, and occupy two slots of a link peripheral processor (LPP) cabinet.

The ADAS application uses an HP 9000-series 700 workstation as the operation, administration, and maintenance position.

Restrictions and limitations

Due to memory limitations, only one application can be installed on an APU.

Feature interactions

This feature interacts with the following features:

- AJ0839 Binary Elector
- AN0162 COVM APU Software Installation, Phase II
- AI0302 IWS Multinodal Interprocess Communication
- AR0142 SuperNode File Transfer, Phase II

This feature also modifies feature AN0069 (ADAS UNIX Loadbuild and Software Installation).

Datafill

Table	Description
SNIXAPPL	Value ADAS and subfields added to field APPLTYPE

Logs

This feature adds log USLG100. The log is generated if the specified system resource cannot be allocated.

Feature name

AINSSP Base: Trigger Tables

Description

This feature forms part of the base framework for Advanced Intelligent Network (AIN) architecture. It provides the table control for provisioning triggers and for trigger criteria. It also implements datafill and data query enhancements that are necessary to support AIN.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Deletion of data from table TRIGGRP is allowed only when AIN is not active, and when the data is referenced in table TRIGGRP. However, if a call is referencing the data, the call may not trigger properly.

Changes to the data in table TRIGGRP are allowed only when AIN is not active, or during dump and restore.

Datafill

Table	Description
TRIGGRP	New table
TRIGDIG	New table
TRIGINFO	New table
DNFEAT	New table
LENFEAT	Fields AIN and AINGRP added
IBNFEAT	Fields AIN and AINGRP added
KSETFEAT	Fields AIN AINGRP and KEYLIST added
TRKGRP	Fields AIN and AINGRP added
CUSTSTN	Fields AIN and AINGRP added
DNROUTE	Value AIN added to FEATURE field. Fields DNTYPE, CUSTGRP, SUBGRP, LINEATTR, AINOPT, and NCOS added

The following six parameters are created for this feature:

- AIN_ACTIVE
- AIN_NUM_EXT_BLKs
- AIN_MAX_SERIAL_TRIGGERS
- AIN_T1_TIMER
- AIN_OFFICE_TRIGGRP
- TRIGDIG_NUM_DGLTR_POOLS

All of the above parameters are contained in table OFCENG.

Service orders

Service orders are enhanced to allow the subscription to AIN for the following users:

- POTS lines
- Meridian Digital Centrex (MDC) and Residential Enhanced Service (RES) lines
- Electronic business sets (EBS) and Meridian feature transparency (MFT) terminals

The AIN Directory Number (AINDN) option can also be activated through SERVORD on a directory number basis.

User interface

The query commands are enhanced to display the type of terminal that has subscribed to AIN. The corresponding AIN behavior is also displayed.

Feature name

AIN Recorded Announcements Enhancements

Description

This feature provides an interface into the existing customized announcements capability in a DMS service switching point (SSP). The interface indicates which announcement should be played, based upon the announcement identifier received.

BCS history

This feature was created in BCS36.

Restrictions and limitations

A maximum of 32 phrases can be pronounced upon receipt of a StrParameterBlock.

A maximum of 24 phrases can be composed by digits phrases.

Feature interactions

This feature interacts with feature AR0229 (AIN Base: Trigger Processing II) if collection of subsequent digits from a calling party is required.

This feature interacts with feature AR0229 and feature AR0374 (AINSSP: AIN Message Encoder/Decoder II) to report certain announcement failures to the off-board processor.

This feature interacts with feature AR0229 and feature AR0242 (AINSSP: AIN OM) to register an operation measurement on receipt of a system announcement identifier that is not datafilled within the SSP.

Datafill

Table	Description
AINANNS	New table

Operational measurements

Operational measurement INVCMDMG registers if the StrParameterBlock parameter contains a system announcement identifier that is not datafilled in table AINANNS.

AR0235

Feature name

AINSSP: Basic Trunks Trigger Processing II

Description

This feature aligns the DMS basic trunk call processing software with the advanced intelligent network (AIN) basic call models. In addition, the feature implements the AIN trigger detection points applicable to trunk facilities.

BCS history

This feature was created in BCS36.

Restrictions and limitations

All public facility trunk groups can subscribe to the shared interoffice trunk trigger, but only the intertoll trunk groups can trigger as a result of this trigger.

This feature does not support the processing of a call that is identified by the automatic number identification II (ANI-II) information as requiring AIN processing.

This feature does not support identification based upon the called digits received within the signaling.

Datafill

Table	Description
STDPRT	Selector SSP added

Feature name

AINSSP: AIN AMA

Description

Feature AR0238 provides Bellcore automatic message accounting (AMA) format (BAF) recording for Advanced Intelligent Network (AIN) release 0.1, as defined in Bellcore Technical Advisory, *Advanced Intelligent Network 0.1 Switching Systems Generic Requirements* (TA-NWT-001284, issue 1).

A service switching point (SSP) is a switch that can recognize a call that requires AIN processing by an off-board processor, such as a service control point (SCP), without making assumptions about the service being provided. The SSP produces BAF records for AIN calls as specified by the off-board processor and switch-based translations. The response message sent from the off-board processor may contain optional parameters that are used by the SSP billing function.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Message Detail Recording (MDR) is not provided by this feature.

AIN billing and universal billing are mutually exclusive. Universal billing takes precedence.

Some switch-based features cause a module to be appended to the AMA record that is generated for a call during which the feature is active. With such a module appended, it is not possible to generate a corresponding AIN AMA record for any feature that is not supported for AIN.

Feature interactions

This feature interacts with existing switch-based billing features as follows:

- When a call triggers for the first time, any currently open AMA billing record is discarded. The off-board processor is responsible for sending AMA parameters to restart the billing record. Failure to do this results in loss of the switch-based AMA record for that call. If the call retranslates and becomes a billable call, then a switch-based record is started.
- When either the 3/6/10 Public Office Dial Plan (PODP) trigger or the terminating attempt trigger is met, then a new call leg is established. Any billing (switch-based or AIN) is closed and a new record is started, provided the off-board processor response indicates this. The internal registers that monitor the number of AMA parameters received are reset to initial values.

- Calls that produce terminating billing records will continue to produce these records, along with any AIN billing that occurs on the call.
- The Conference Trunk Usage and Call Forwarding AMA records continue to be produced in addition to the AIN record or switch-based record for interactions with Three-Way Calling and Call Forwarding.
- All AMA pretranslation information is discarded unless the call retranslates following an AIN query.
- If a Centrex line or trunk originates a call that requires a Station MDR (SMDR) call record based on the originating line or trunk group data or IBN translation datafill, the SMDR record will be generated whether or not the call is an AIN call. The SMDR call record generated is a result of the dialed digits. Any retranslation that results directly from an AIN response does not produce an additional SMDR record.

Datafill

Table	Description
AMAOPTS	Option UNANS_AIN added
BCCODES	Tuple AIN added

Operational measurements

Three new operational measurement (OM) registers are provided for tracking AIN AMA errors:

- AMAMAX is incremented whenever the maximum parameter count per AMA record is exceeded.
- AMASLPID is incremented whenever any AMA parameters arrive at the SSP before an AMASlpID parameter.
- AMACONV is incremented whenever any AMA parameters are received in a conversation package.

Automatic message accounting

This feature implements the following functionality:

- AIN Call Completion Structure Code 0220
- AIN Call Termination Structure Code 0221
- Translation Settable Module Code 030
- Service Logic Program Identification Module 039
- Digits Module 040
- Account Code Module 103
- AIN Default Call Type 047
- AIN Default Service Feature 027

Feature name

AINSSP: AFR Trigger Preparatory

Description

This feature provides the automatic flexible routing (AFR) trigger, which initiates a database query when all routes in the routing list of a call are unavailable.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature applies to SuperNode switches only.

This feature supports subscription of triggers for the following line types only:

- POTS individual flat rate, residence (1FR)
- POTS individual message rate, residence (1MR)
- Residential Enhanced Services lines (RES)
- Private branch exchange rate (PBX)
- Private branch exchange message rate (PBM)
- Integrated Business Network (IBN)
- Electronic business set (EBS)

This feature supports subscription of triggers for the following trunk types only:

- Incoming end office (T1)
- Two-way end office (T2)
- Intertoll (IT)
- Integrated Business Network (IBNT1, IBNT2)
- Primary rate interface

Triggering at the AFR trigger detection point (TDP) will not occur if the originating agent is not a supported Advanced Intelligent Network (AIN) agent.

NTXQ43AA

AIN RO.1 SSP

This feature package supplies software to create an Advanced Intelligent Network (AIN) environment by providing trigger detection points in the call processing architecture of the service switching point (SSP). Trigger detection points enable the operating company to create and modify services for subscribers. The feature package also provides enhanced translation verification to cover AIN-specific information in an AIN office.

This feature package applies to DMS-100 offices.

NTXQ43AA

AR0220

Feature name

AINSSP: TDPS and TRIGGERS I

Description

This feature will enable the Advanced Intelligent Network (AIN) Release 0.1 Call Processing services on a Service Switching Point (SSP). This is achieved by allowing the Operating Company to assign triggers on an office wide basis or on an individual Directory Number (DN) or group subscription basis.

BCS history

This feature was created in BCS36.

Feature name

AINSSP Base: Trigger Processing II

Description

Advanced Intelligent Network (AIN) provides operating companies with the capability of creating and modifying telecommunications service for subscribers. This is accomplished by providing trigger detection points (TDP) in the call processing architecture of the service switching point (SSP), where the call is suspended until direction is given by a service control point (SCP), or a database or processor capable of sending AIN version 0.1 messages to the SSP (adjunct).

This feature introduces the following activities:

- accumulation of the information required to communicate with, and query, the SCP or adjunct
- interpretation of messages from the SCP or adjunct, and implementation of appropriate call processing actions

BCS history

This feature was created in BCS36.

Restrictions and limitations

The DMS system supports only the following values when populating the userID parameter in query messages:

- IMPLICIT DN
- IMPLICIT Trunk Group ID
- IMPLICIT Private Facility GID

Local access and transport area (LATA) is not supported in the following situations:

- Non-equal-access end offices
- private facilities making private calls
- incoming trunks

Since there is no means of triggering in these situations, the DMS system, when populating the called party ID parameter, does not support the following values for the NATURE OF NUMBER field:

- a 950+ call from a local exchange carrier public station, a hotel or motel line, or a non-equal-access end office (EAEO)
- test line test code

The access code parameter is not supported for feature access codes.

The charge party station type is supported, subject to the following restrictions:

- the appropriate DMS packages must be available
- values for ISUP and MF are supported only if they are also supported by the relevant DMS system protocols
- AIN01 value is not supported for originating line facilities

The primary carrier parameter is applicable only to equal access offices.

Since feature interactions with public features are not allowed, the vertical service code parameter is not supported for SSPs.

The travelling class mark (TCM) parameter is subject to the following restrictions:

- it will not be built as part of the termination attempt query message
- the parameter will not be provided if the originating access is from an SS7 trunk and the type of digits is specified as “private network TCM”

Datafill

Table	Description
TMTCNTL	Treatment types AIND and AINF added
TMTMAP	Treatment types AIND and AINF added

The following new office parameters have been added to table OFCENG:

- AIN_NUM_EXT_BLKs
- AIN_NUM_PROCESSING_EXT_BLKs

The following office parameters in table OFCENG have been changed:

- NO_OF_HIS_DATA_BLKs
- NO_OF_HIS_CONTROL_BLKs
- NO_OF_FTR_XLA_BLKs
- NUM_RC_EXT_BLKs

Operational measurements

This feature creates the following operational measurement (OM) fields in the TRMTFR2 OM group:

- TFRIND. This measures the number of calls that are disconnected due to a request from the SCP or adjunct
- TFRINF. This measures the call failures due to fatal call-related errors

Feature name

AINSSP Base: AIN TRAVER

Description

This feature enhances translation verification (TRAVER) to cover advanced intelligent network (AIN)-specific information in an AIN office. The feature covers AIN version 0.1.

BCS history

This feature was created in BCS36.

Restrictions and limitations

With the implementation of this feature, TRAVER supports the following agents:

- POTS lines
- Integrated Business Network (IBN) lines
- Residential Enhanced Services (RES) lines
- electronic business set (EBS) lines
- T1 and T2 trunks
- intertoll trunks
- IBN incoming end-office trunk group (IBNTI) and IBN two-way end-office trunk group (IBNT2) trunks
- primary rate interface (PRI) trunks

The following limitations also apply:

- TRAVER does not provide the capability of reading a series of calling and called party number combinations from a file.
- The network busy trigger detection point (TDP) criterion is not fully supported by TRAVER. TRAVER simply displays a message to indicate that if the network were busy, then a trigger would occur.
- TRAVER does not support virtual directory numbers (DN) as originating agents.
- TRAVER does not check if a vertical service code (VSC) is used with the “continue” response.
- If a call originates from a primary rate access trunk and is routed over the public network, the customer group information concerning the originator is still displayed, even if it is not relevant to the call. This also happens if a 9+ call is dialed from an IBN agent.

User interface

TRAVER is enhanced to display the following AIN trigger data tables:

- TRIGGRP
- TRIGDIG
- TRIGINFO
- TRIGESC

The following AIN subscription tables are also displayed:

- subscription on a line basis
 - LENFEAT
 - IBNFEA T
 - KSETFEA T
 - DNFEA T
 - TRKGRP
- subscription on a group basis
 - CUSTSTN
- subscription on an office basis
 - OFCV AR

NTXQ44AA

AIN Test Tools

This feature package supplies Advanced Intelligent Network (AIN) test tools to send queries to and receive responses from off-board processors such as a service control point.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXQ44AA contents	
Feature number	Description
AR0239	AINSSP Tool: Test Queries - I

BCS history

This feature package was created in BCS36.

NTX941AA	CM Common
NTXQ42AA	AIN Base
NTXQ45AA	AIN Generic Messaging

AR0239

Feature name

AINSSP Tool: Test Queries - I

Description

This feature provides the capability of sending advanced intelligent network (AIN) version 0.1 test queries to the off board processor (OBP), such as a service control point (SCP), and receiving responses. The OBP cannot distinguish these queries from normal AIN version 0.1 queries. The functionality is provided by means of the TSTQUERY test tool.

BCS history

This feature was created in BCS36.

Restrictions and limitations

If a message containing an automatic code gap (ACG) installation is received, TSTQUERY displays it, but does not handle the actual installation.

The response time measurement function is not provided.

Caller-abandoned messages are not sent automatically by TSTQUERY.

Automatic Message Accounting (AMA) data will not be generated as a result of TSTQUERY activity.

Feature interactions

This feature uses the following features from the AIN generic message handler in order to interface with the OBP:

- AD4443 Enhancements for Conversational Messaging
- AD4446 Generic RDB Interface Package
- AR0226 AINSSP: Message Encoder/Decoder I

Logs

Each time a message is sent or received by TSTQUERY a report is generated for the AIN log.

User interface

When TSTQUERY is started, the user is provided with a menu of commands to perform the required tasks. No parameters are required for TSTQUERY.

NTXQ48AA

SCP-CBIS SMS Interface

This feature package provides an interface for the Advanced Intelligent Network (AIN) message handler to enable the transaction ID management and timing facility, verify the INVOKE ID utility, and enhance the transaction capabilities application part (TCAP) monitor to increase the maximum number of transaction ideas allowed.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXQ48AA contents	
Feature number	Description
AD4443	RDB Enhancements for Conversational Messaging
AR0374	AINSSP: Message Encoder/Decoder II

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXQ45AA	AIN Generic Messaging
NTXQ55AA	TCAP Monitor Enhancements
NTXR72AA	CCS7 MTP/SCCP for LPP-based Platforms

AD4443

Feature name

RDB Enhancements for Conversational Messaging

Description

This feature provides the transaction ID management and timing facility for the advanced intelligent network (AIN) message handler. It also verifies that the INVOKE ID management works correctly for the AIN application.

This feature enhances the transaction capability application part (TCAP) monitor to increase the maximum number of transaction IDs allowed. In addition, a new TCAP subsystem, designated AIN, is created for the AIN application.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature does not remove the COLD or RELOAD restart requirement whenever table TCAPTRID is modified.

The maximum allowable number of transaction IDs for each switch is 32 000 only if package NTXY97AA (TCAPTRID expansion) is in the DMS switch. If this package is not in the switch, the maximum allowable number of transaction IDs remains at the previous figure of 820.

If package NTXY97AA is in the switch, the total number of transaction IDs datafilled in table TCAPTRID cannot exceed the number specified by office parameter MAX_NO_OF_TRANS_ID.

The maximum number of transaction IDs over all applications is 32 000. Each transaction ID has an associated 50 word data store requirement. It is the responsibility of each application to decide the number of transaction IDs required.

Feature interactions

This feature requires features AD4446 (Generic RDB Interface Package) and AR0227 (AINSSP Base: Message Handler) in order to operate fully.

Datavill

Table	Description
TCAPTRID	Value AIN added to Ffield TCAPAPPL
C7LOCSSN	Value AIN added to field SSNAME
C7NETSSN	Value AIN added to subfield SSNAME

This feature also adds optional office parameter `MAX_NO_OF_TRANS_ID` to indicate the maximum number of transaction IDs allowed. With this parameter installed in the switch, the default maximum number of transaction IDs for the AIN feature is 4096.

AR0374

Feature name

AINSSP: Message Encoder/Decoder II

Description

This feature provides the application protocol interface between the service switching point and an off-board processor. The service control point (SCP) with associated unit (adjunct), if required, is a typical example of an off-board processor. This feature provides application layer messages to be sent to the SCP/adjunct and decodes responses received from the SCP/adjunct.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature differs from Bellcore technical requirement TR-NWT-001284, *Advanced Intelligent Network (AIN) 0.1 Switching Systems Generic Requirements* and from Bellcore technical requirement TR-NWT-001285, *Advanced Intelligent Network (AIN) 0.1 Switch-Service Control Point (SCP) Application Protocol Interface Generic Requirements* in the following areas:

- Parameter Display_Text in message Authorize_Term is not decoded
- The following parameters are partially encoded or decoded
 - UserID (the sub-parameter sequence of Spid and Dn is not handled)
 - Failed_Message (only parameter ID is sent in Failed_Message for erroneous data value application error)
- Missing mandatory protocol error is detected after the detection of all application errors
- Missing mandatory protocol error is reported using a different problem code or incorrect parameter protocol
- SendToResource message, when received in a conversation package, with parameter ResourceType set to Play Announcements Collect Digits, and DisconnectFlag present, is treated as a non-fatal error.

Feature interactions

This feature provides the encoding and decoding capabilities for the complete AIN release 0.1 message set, as defined in TR-NWT-001285. However, features that interact with this feature, and are responsible for processing these messages, do not handle the complete message set.

The following lists the other features that interact with this feature, and the messages that are processed by them:

- AR0229 AINSSP Base Trigger Processor. This feature is responsible for processing both query and response messages. It does not handle any of the non-call-related messages
- AR0239 AINSSP Tool: Test Queries I. This feature does not process the following SCP originated messages and their associated responses:
 - SCP - Monitor_For_Change
 - SCP - Update_Request
 - SSP - Monitor_Success
 - SSP - Status_Reported
 - SSP - Update_Data

NTXQ50AA

AIN Local Base

This feature package forms part of the base framework for advanced intelligent network (AIN) architecture by supporting datafill and data queries for AIN.

This feature package applies to DMS-100 offices.

AR0219

Feature name

AINSSP Base: Trigger Tables

Description

This feature forms part of the base framework for Advanced Intelligent Network (AIN) architecture. It provides the table control for provisioning triggers and for trigger criteria. It also implements datafill and data query enhancements that are necessary to support AIN.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Deletion of data from table TRIGGRP is allowed only when AIN is not active, and when the data is referenced in table TRIGGRP. However, if a call is referencing the data, the call may not trigger properly.

Changes to the data in table TRIGGRP are allowed only when AIN is not active, or during dump and restore.

Datafill

Table	Description
TRIGGRP	New table
TRIGDIG	New table
TRIGINFO	New table
DNFEAT	New table
LENFEAT	Fields AIN and AINGRP added
IBNFEAT	Fields AIN and AINGRP added
KSETFEAT	Fields AIN AINGRP and KEYLIST added
TRKGRP	Fields AIN and AINGRP added
CUSTSTN	Fields AIN and AINGRP added
DNROUTE	Value AIN added to FEATURE field. Fields DNTYPE, CUSTGRP, SUBGRP, LINEATTR, AINOPT, and NCOS added

The following six parameters are created for this feature:

- AIN_ACTIVE
- AIN_NUM_EXT_BLKs
- AIN_MAX_SERIAL_TRIGGERS
- AIN_T1_TIMER
- AIN_OFFICE_TRIGGRP
- TRIGDIG_NUM_DGLTR_POOLS

All of the above parameters are contained in table OFCENG.

Service orders

Service orders are enhanced to allow the subscription to AIN for the following users:

- POTS lines
- Meridian Digital Centrex (MDC) and Residential Enhanced Service (RES) lines
- Electronic business sets (EBS) and Meridian feature transparency (MFT) terminals

The AIN Directory Number (AINDN) option can also be activated through SERVORD on a directory number basis.

User interface

The query commands are enhanced to display the type of terminal that has subscribed to AIN. The corresponding AIN behavior is also displayed.

AR0228

Feature name

AINSSP: AIN Feature Interactions - I

Description

This feature provides interworking between selected features and the Advanced Intelligent Network (AIN) version 0.1 call model, in accordance with the specifications contained in Bellcore technical requirement TR-NWT-001284, *Advanced Intelligent Network (AIN) 0.1 Switching Systems Generic Requirements*.

BCS history

This feature was created in BCS36.

Restrictions and limitations

AIN distinctive ringing is supported only on peripherals using coded ringing.

One of the enhanced call waiting packages NTX807AA, NTX807AB, NTX824AA, or NTX824AB must be present in the office in order to use enhanced call waiting tones.

It is recommended that parameter CallingPartyID always be sent as a 10-digit number to ensure the correct interaction with custom local area signaling service (CLASS) and simplified message desk interface (SMDI) features.

It is recommended that parameter RedirectingPartyID always be sent as a 10-digit number to ensure the correct interaction with SMDI features..

If a call involves a number of switch-based and AIN redirections, other than call forwarding, the order of redirections is not, at present, being tracked. In this situation the forwarding directory number and the type of call forwarding sent to to the SMDI link may not be correct.

When originating a 911 call, subscribed originating triggers at the information collected trigger detection point (TDP) in the originating office will take precedence over 911 features, unless 911 is dialed as an escape code.

Feature interactions

This feature provides interworking between a number of features and the AIN call model.

This feature package supports the following processes:

- define and create the virtual network services (VNS) databases for the service control point (SCP), Virtual Communication Network (VCN), or Virtual Private Network (VPN), as appropriate, based upon the market-specific requirements
- provide an interface to the transactional record management system (TRMS) layer
- allocate the storage resources required for the processing of VNS query or update transactions

This feature package applies to DMS-100 offices.

SCP VNS Database Create and Access

Description

This feature supports the following processes:

- define and create the virtual network services (VNS) databases for the service control point (SCP), Virtual Communication Network (VCN), or Virtual Private Network (VPN), as appropriate, based upon the market-specific requirements
- provide an interface to the transactional record management system (TRMS) layer
- allocate the storage resources required for the processing of VNS query or update transactions

BCS history

This feature was created in BCS36.

Feature interactions

This feature is invoked by the following features:

- AR0400 VNS Service Query Processing
- AR0339 SCP Database Audit

This feature package enhances the service application framework layer of the service control point (SCP) in the following ways:

- enables the service management system to audit a service control point database using database management retrieve requests
- provides a command interface to capture and display SCP transaction control blocks during query processing
- provides four additional flexible service logic building block types
- implements enhancements to the SCP database tools
- improves the robustness and performance of query and update processing

This feature package applies to DMS-100 offices.

Feature name

SCP/SMS Audit Efficiency

Description

This feature enables the service management system (SMS) to audit a service control point (SCP) database using database management retrieve requests without having to process response files. The SMS can use the last key retrieved in the retrieve response to determine the next key to be issued for the next retrieve request of an audit.

BCS history

This feature was created in SCP02.

Feature interactions

This feature enhances feature AL2093 (SCPII Update Batch Handling).

Feature name

TCB Dump Utility

Description

Transaction control blocks (TCB) are data blocks that are used to store query information for the second generation service control point (SCP) node during query processing. This feature provides a command interface to capture and display SCP TCBs during query processing.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature is available to only one user at a time for each node.

This feature has a pre-determined store limit of 500 TCBs.

User interface

This feature introduces a new command interface, TCBCI. TCBCI provides access to a series of subcommands that control the operation of the utility.

NTXQ54AB

AR0406

Feature name

Additional FSL Building Blocks

Description

This feature enhances the service application framework layer of the service control point (SCP) by providing four additional flexible service logic (FSL) building block types.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature does not provide update processing validation on the new FSL building blocks.

Feature name

SCPII Database Tools

Description

This feature implements enhancements to the following service control point (SCP) database tools:

- AFRECMAN
- TRMSDBREQ
- UPDBREQ

BCS history

This feature was created in BCS36.

Feature interactions

This feature enhances feature AQ0944 (SCPII GIN Building Blocks - Query Processing).

User interface

In directory AFRECMAN, ten commands have been changed. A HELP command has also been added.

In directory TRMSDBQ, five commands have been changed. A HELP command has also been added.

NTXQ54AB

AR0704

Feature name

SAF Phase II

Description

This feature provides a number of enhancements to the service control point (SCP) application framework (SAF) layer code to improve the robustness and performance of query and update processing.

BCS history

Feature name

AINSSP: Release 0.1 on the TCP/IP Transport Protocol

Description

This feature modifies the Advanced Intelligent Network (AIN) Release 0.1 test query, trigger processing and trigger tables to support interaction with the Transmission Control Protocol/ Internet Protocol (TCP/IP) transport protocol.

BCS history

This feature was created in BCS36.

Restrictions and limitations

One socket address per application is allowed. A hot standby link is not supported for TCP/IP transports.

Feature interactions

The Test Query command for AIN Release 0.1 is updated to include the option to route messages over the Ethernet network. Please refer to feature AR0239, "AINSSP TOOL: Test Queries - I".

The relationship between application/instance and TCP/IP socket address is datafilled internally via a CI command. This CI command is expanded fully in feature AR0521, "TCAP Over Ethernet".

Datafill

Table	Description
TRIGDIG	changes to table
TRIGINFO	changes to table

The transport field in table TRIGINFO is changed by this feature. For the TCPIP selector, a subfield INSTANCE representing the instance number of the TCP application is added. The application name and instance number are mapped internally to the TCP/IP socket address of an application service provider (ASP) in an off-board processor.

EADAS Hardware Inventory Freeze-Part II

Description

This feature modifies several peripheral inventory tables adding a new field to hold an administrative number. The table modified are LMINV, DLMINV, RCTINV, IPEINV, LTCINV, LCMINV, RCSINV, RCUINV, LDTINV AND RDTINV.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The value of the ADNUM field must be unique across all of the peripheral inventory tables. Attempts to add a PM with an ADNUM already in use are rejected. The craftperson will see one message indicating the selected ADNUM is already in use and another message giving the next available ADNUM value.

The ADNUM field in inventory tables may not be changes if Operational Measurement (OM) counts for the PM are included in an EADAS/DC section associated with RLCDIS or RSCIS. Attempts to do so will result in a message indicating that the PM has active counts against it in an EADAS/DC section.

Datafill

Table	Description
RCCINV	A new field is added

A new field, ADNUM, is added to table RCCINV. This field holds the administrative number associated with a given PM.

Logs

OMPRnnn logs are generated as defined in the OM scheduling system. OM scheduling to the log system and the distribution for the log output are defined by a craftperson. OMPRnnn logs that contain OM groups RLCDIS or RSCIS will now use the AADNUM value of the PM as identifiers for the tuples within these groups. These ADNUM values are associated with the PM when datafilled in the peripheral inventory tables.

User interface

The EADAS/DC CI commands EADASKEY and EADASFMT are altered to accept ADNUM values for the record id when an EADAS/DC section is associated with OM groups RLCDIS or RSCIS.

Operational measurements

The ADNUM value will be used as the new key for indexing into OM data for OM groups RLCDIS and RSCIS.

NTXR49AA

Dialable Wideband Service PRI

This feature package provides user-controllable access to bandwidths ranging from 128 kbyte/s through 1.5 Mbyte/s over an ISDN PRI loop.

This feature package applies to DMS-100 offices.

Feature package contents

AD4735

Feature name

LEC DWS FGD ISUP to PRI

Description

This feature provides feature group D (FGD) ISDN user part (ISUP) trunk interworking with North American primary rate interface (PRI) trunks for dialable wideband services.

BCS history

This feature was created in BCS36.

Hardware requirements

The enhanced network (ENET) is required to provide constant delay among all the wideband DS-0 channels across the switching network.

The digital trunk controller (DTC) must be equipped with the NTAX78AA card (digital cellular timeswitch card). This provides a constant delay across the ISDN digital trunk controller (DTCI).

DTCI frame NT6X01AB (ISDN common peripheral controller equipment frame) is required for the CCS7 digital trunk controller (DTC7).

A 6X50AB card (DS-1 EFF card), rev. 67 or greater, is required.

Feature interactions

This feature interacts with the following features:

- AD4732 LEC DWS FGD ISUP
- AD4449 LEC WSS PRI

QMS External Management Information System Interface

This feature package provides an interface between the TOPS Queue Management System (QMS) Automatic Call Distribution (ACD) and an external vendor.

This feature package applies to DMS SuperNode offices.

Feature package contents

Feature package NTXR50AA contents	
Feature number	Description
AF2964	QMS: MIS Interface

Required feature packages	
Feature package number	Description
NTXR48AA	QMS: Call and Agent Manager

AF2964

Feature name

QMS: MIS Interface

Description

AF2964 provides an interface between the TOPS queue management system (QMS) Automatic Call Distribution (ACD) and an external vendor. This feature provides data to vendors with a management information system (MIS) that can monitor individual operator and queue performance. The DMS sends the pertinent event information continuously over X.25 data links to the external MIS, which manages the calculations, format, and display of the reports.

BCS history

This feature was created in BCS34.

BCS36 Changed

Hardware requirements

This feature requires an NT1X89AB card (extended multiprotocol controller (EMPC)).

Restrictions and limitations

When a buffer is ready to be transmitted and no EMPC links are in service, then the contents of the buffer are discarded, and all the messages in the buffer are lost.

On occasions when the DMS time of day (TOD) is changed forward or backward, the report boundary time is realigned to follow the new TOD.

Feature interactions

This feature requires the following features:

- AF2783-QMS: Call and Agent Manager
- AF2875-QMS: Call Queue Assignment
- AF2965-QMS: Basic MIS Stats

In a TOPS stand-alone environment, the following feature is also required:

- AF2876-QMS: Stand-alone Call Processing Changes

In a TOPS operator centralization *host* environment, the following feature is also required:

- AF2877-QMS: Host Call Processing Changes

In a TOPS operator centralization *remote* environment, the following feature is also required:

- AF2878-QMS: Remote Call Processing Changes

Datafill

Table	Description
QMSMIS	Table added to datafill the links used by the QMS MIS application
TQMISOPT	Table added to datafill office parameters used by the QMS MIS

This feature adds office parameter TQMS_MIS_MPC_BUFFS to table OFCENG as a tuple for the QMS MIS interface.

This feature increases data store by a maximum of 135 Kbytes and increases program store by a maximum of 28 Kbytes.

Operational measurements

This feature adds operational measurements (OM) group QMSMIS to measure message activity for the QMS MIS interface.

These counts include

- the number of messages (for both position events and call queue events) generated by the TOPS QMS
- the number of message buffers sent successfully to the FM vendor
- the number of message buffers that the DMS failed to send

The following registers are used to peg these counts: POSMSG, POSMSG2, QMSG, QMSG2, BUFFSX, BUFFSX2, and BUFFAIL.

Logs

This feature adds log QMIS100, which is generated each time an MPC data link fails to transmit a TOPS QMS MIS buffer.

This feature also adds logs MIST100-104. These are debugging logs that are turned on by means of a datafillable office parameter, TQMS_MIS_TEST_LOGS, in table OFCENG.

This feature modifies log EXT107 and log EXT108.

Log EXT107 is generated each time the TOPS_QMS_MIS_MAJOR alarm or the TOPS_QMS_MIS_MINOR alarm goes on or off.

NTXR50AA

AF2964

Log EXT108 is generated each time any of the following critical alarms go on or off: TOPS_QMS_MIS_CRITICAL, TOPS_QMS_MIS_PROCESS, or TOPS_QMS_MIS_BUFFS.

User interface

The system does not restart the MPC child process; this process can be restarted by issuing command REVIVE from the MPC MAP level.

Stutter Dialtone Enhancements

This package allows Stuttered Dialtone MWI to work with such devices as autodialler.

This feature package applies to DMS-100 offices.

AN0303

Feature name

Variable Stuttered Dialtone

Description

This optional feature will allow the time the subscriber hears Stuttered Dialtone (STD) for Message Waiting (MWT) to be set in one second intervals from 1 to 7 seconds on a switch wide basis. After the interval has elapsed, the subscriber hears normal continuous dialtone. Presently, the subscriber with Stuttered Dialtone as their Message Waiting Indication (MWI) upon going offhook hears Stuttered Dialtone continuously if a message is queued until digits are entered. Some devices such as autodiallers expect continuous dialtone before outpulsing digits. This feature allows Stuttered Dialtone MWI to work with these devices. The default value will be set to 0 which will indicate that Stuttered Dialtone will be continuous until the subscriber inputs digits.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature applies only to lines with STD as their MWI. This feature does not effect lines with a lamp as their MWT.

Lines that do not have a UTR (universal Tone Receiver) available for digit reception may exhibit a perceptible dialtone start time under traffic. Due to the different messages that are used for UTRs and receivers, this is unavoidable. Worse case will be remotes not serviced by UTRS.

A possible race condition exists when the value `VARIABLE_STUTTER_DIALTONE_TIMING` is changed from a non zero value to zero. If a line that is not serviced by a UTR happens to be in the set up stage for stutter dialtone when the value is changes to zero, a default value of 2 seconds of stutter dialtone will be given for the particular line(s) only for this origination. Upon the next origination if a message is queued, continuous stutter dialtone will be presented if `VARIABLE_STUTTER_DIALTONE_TIMING` is still zero.

Lines that are in progress of receiving stutter dialtone when this value is updated will use the old value until the next origination.

This feature does not work with ground start lines.

Feature interactions

This feature interacts with MWT. When the feature is active, lines with MWT and STD as their MWI will receive stuttered dialtone for the number

of seconds datafilled in office parameter
VARIABLE_STUTTER_DIALTONE_TIMING in table OFCVAR.

Datafill

Table	Description
OFVCAR	A new tuple is added

The range of values will be 0 to 7 with 0 as the default. This is the number of seconds lines with STD as the MWI will hear stuttered dialtone before normal dialtone is heard. A value of 0 indicates continuous stuttered dialtone with no change to normal dialtone.

NTXR63AA

Large Capacity SRDB

This feature package provides increased capacity for the E911 selective routing database (SRDB).

This feature package applies to DMS-100 offices.

This package does not replace package NTX451AA (E-911 Database). The two packages are mutually exclusive. Package NTX451AA limits table E911SRDB to 800 000 tuples, and should be used for smaller selective routing database needs.

AN0102

Feature name

SRDB Capacity Enhancements

Description

This feature provides capacity enhancements for the E911 selective routing database (SRDB).

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature applies only to the SuperNode switch.

The number of tuples in table E911SRDB is now limited by the amount of data store available on the E911 tandem switch.

There is a limit of 16 serving numbering plan areas.

There is a limit of 4 numbering plan digits.

Feature interactions

This feature interacts with the E911 aspects of the following feature packages:

- NTX447AA E911 Tandem
- NTXF61AA E911 ACD PSAP Integration
- NTP58AA VFG Support for E911
- NTXQ18AA E911 Memory Management
- NTXN60AA Dial Up into ALI Database for SRDB Update

Datafill

The tuple limit on table E911SRDB is removed by this feature. The table limit is now restricted only by the amount of data store available on the E911 tandem switch.

User interface

The communications interface command QSRDB is changed to allow the new limit on table E911SRDB to be set.

NTXR66AA

DWS Access to Carrier (Access Tandem)

This feature package provides wideband call processing for access to carrier (ATC) trunks on DMS-100 and DMS-200 switches, using feature group D (FGD) ISDN user part (ISUP) signaling.

This feature package applies to DMS-100 offices.

AD4732

Feature name

LEC DWS FGD ISUP

Description

This feature provides local exchange carrier (LEC) wideband call processing for access to carrier (ATC) trunks on DMS-100 and DMS-200 switches, using feature group D (FGD) ISDN user part (ISUP) signaling.

BCS history

This feature was created in BCS36.

Hardware requirements

The enhanced network (ENET) is required to provide constant delay among all the wideband DS-0 channels across the switching network.

The digital trunk controller (DTC) must be equipped with the NTAX78AA card (digital cellular time switch card). This provides a constant delay across the digital trunk controller (DTC).

XPM peripheral life upgrade strategy (XPM PLUS) is recommended to run on the CCS7 digital trunk controller (DTC7).

Since ENET is only available on SuperNode, this feature is only applicable to a SuperNode switch.

Restrictions and limitations

If an ISUP initial address message (IAM) with wideband indicators is received on a non-wideband ATC ISUP-FGD agency, the call will receive BC_NOT_IMPLEMENTED treatment.

If an originating wideband call is translated so as to attempt to terminate on a non-wideband trunk group, then the call will route advance until a wideband trunk group is reached.

Each wideband call requires two extension blocks.

Wideband test calls, continuity testing, off-hook and on-hook queuing, abbreviated dialing, and speed calling are not supported by this feature.

Feature interactions

In order to function properly, this feature requires the following features:

- AD4735 LEC DWS FGD ISUP to PRI
- AD4749 IEC DWS FGD ISUP

This feature also uses logs created by the following features:

- AJ2864 Switched Wideband on the ASGW (WB log 105)
- AD4751 DWS Trunk Audit (WB logs 106 and 107)

This feature is also dependent upon the glare recovery implementation of feature AD3318 (Wideband Trunk Datafill and Maintenance).

Datafill

Table	Description
TRKGRP	Option WIDEBAND added for ATC trunk groups. Subfields WBSELSEQ, WBGRPING and WBSEARCH added.

The following datafill requirements and recommendations apply to this feature:

- All of the DS-0 trunks used in a wideband call must be datafilled in the same trunk group and reside on the same DS-1 span.
- It is recommended that all DS-0 trunks datafilled on the T1 link be in the same trunk group.
- It is recommended that the circuit identification codes and T1 spans be datafilled consecutively and be consistent at both ends of the spans.
- In table TRKSGRP the glare type (GLARETYP) must be SGRPYLD.

Operational measurements

This feature creates the following three new wideband operational measurements (OM):

- TWBSWTCH counts the total number of wideband intra-switch call attempts
- TWBINTER counts the total number of wideband inter-LATA (local access and transport area) call attempts
- TWBINTRA counts the total number of wideband intra-LATA call attempts

Automatic message accounting

The wideband module code 913 is appended to the automatic message accounting (AMA) recording unit. This module code contains a count of the number of circuits used in the wideband call.

For calls originating within the LATA, an originating access billing record is generated in the DMS-100 switch. For calls entering the LATA from an interexchange carrier (IEC), a terminating access billing record is generated at the first point at which the call enters the LATA.

CCS7-MTP/SCCP for LPP-based Platforms

This feature package contains features that modify linkset management. It also allows for national and international variations of point codes.

This feature package applies to DMS-100 SuperNode and DMS-STP offices.

AL2334

Feature name

SRC Controlled Restart and No-Restart SWACT for CCS7

Description

This feature allows the system recovery controller (SRC) to control the recovery of Common Channel Signaling 7 (CCS7) links, linksets, routesets, and pools during warm, cold, and reload restarts, or during a no-restart switch of activity (SWACT).

BCS history

This feature was created in BCS36.

Restrictions and limitations

The no-restart SWACT for CCS7 offices is a function of office size, and certain configurations may not meet the target maximum of 30 seconds for complete switch recovery. Partial call processing will be available within the 30-s limit.

This feature does not support the CCS7 part of service control point I (SCPI) nodes.

This feature does not support the CCITT-based versions of signal connection control part (SCCP).

Feature interactions

This feature is one of four features that function together to allow CCS7, link peripheral processors (LPP), and ISDN user part (ISUP) to use the SRC for core restart recovery. The other features are as follows:

- AI0704 SRC Restart and No-Restart SWACT Support for SCCP and DDM
- AI0705 SRC Restart and No-Restart SWACT Support for LIMs and LIUs
- AR0467 SRC Restart and No-Restart SWACT Support for ISUP

AJ2878

Feature name

Committed Information Rate for DataSPAN

Description

This feature implements committed information rate (CIR) capability on DataSPAN frame relay interface units (FRIU).

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature does not provide operational measurements (OM) for individual private virtual circuits (PVC).

This feature does not include dynamic rate reduction.

Datafill

Table	Description
FRSCIR	New table
FRSACCCN	Fields SRCCIR, SRCINDEX, DESTCIR, and DESTINDEX added to specify the CIR template on the source and destination endpoints
FRSTRKCN	Field CONTYPE and refinement CIR added to specify the CIR template index on the agent or data link connection identifier (DLCI)
FRSCNEND	Fields SRCCIR and DESTCIR added to specify the CIR template index on the agent or DLCI

Operational measurements

Two new registers are added to FRSAGENT by this feature. CIRDISC counts the number of frames discarded at the user-to-network input channel because they exceeded the summed information rate (SIR) of committed burst size (Bc) plus excess burst size (Be). CIREXCES counts the number of frames that exceed Bc.

User interface

Commands QPLLC, QRYCHAN, and PVDNCI are modified to allow tracing of CIR information.

Automatic message accounting

This feature does not provide billing based upon Be or Bc.

NTXR88AA

Network Access Registers for DMS-100

AN0322

Feature name

Network Access Registers (NARS)

Description

This feature allows enhanced method of throttling or “trunk equivalency” for calls into and from a meridian digital centrex (MDC) customer group.

BCS history

This feature was created in BCS36.

Feature interactions

Call Forwarding

NARS will interact with Call Forwarding Features. When a call reaches a station with call forwarding active and a NAR is encountered on the forwarded-to route, the call will need to gain access to a NAR member before proceeding.

Hunt Groups

Calls made to hunt groups will use the Customer Group and NCOS of the Pilot hunt member to throttle the incoming call to three hunt group. Calls from hunt group members will use the Customer Group and NCOS assigned to that member when considering NARS.

Multiple Appearance Directory Numbers (MADN)

Calls terminating on MADN groups will use the Customer Group and NCOS of the primary MADN member to determine whether the call should be throttled. Calls from MADN members will use the Customer Group and NCOS assigned to that member when considering NARS.

Attendant Consoles

Calls terminating on Attendant Consoles will use the Customer Group Nars. NCOS based NARS will not be applicable when terminating on the Attendant Console. Calls from Attendant Consoles will use the Customer Group and NCOS assigned to the Attendant Console when considering NARS.

Direct Inward System Access (DISA)

Outgoing NARS may have access to three different NCOS for DISA. The DISA feature may use the NCOS specified by the external NCOS in table CUSTHEAD. DISA may be assigned the NCOSOPT in table DNROUTE. The DISA feature may be used in conjunction with the Authorization Code feature by setting the DNROUTE field AUTHREQ to Y.

ACB/AR

A party will be allowed to activate ACB on calls that required access to a NAR. Once ACB/AR has been activated, the system rings the activator

when the called party becomes idle. When the ACB/AR activator picks up the receiver, the system will cause the call to retranslate. If there are no NAR members available the call will route to the NAR overflow treatment.

LNR

When a station activates LNR and the rout requires NAR access, the call will be required to gain access through the NAR before terminating.

Overlap Carrier Selection

Overlap Carrier Selection is permitted with NARS.

Overlap Outpulsing

Overlap Outpulsing is permitted with NARS.

ESA

NARS will not be available during Emergency Stand-Still (ESA).

Restrictions and limitations

If the NARS option is datafilled both in tables CUSTENG and NCOS, then the NCOS NARS option will be considered.

Datafilling NILNAR in fields NAROUT and NARIN of table CUSTENG, may cause a call not to be throttled. The call may be allowed to continue without gaining access through a NAR.

MARS overflow of busy treatment (T60) may be confusing to an end user. An end user with the ACB/AR or RAG features may be confused if upon answering the recall they hear busy treatment due to NAR unavailability.

A call from a customer group terminating back into that same customer group may be throttled if translations and routing determine the call is throttleable. This is true even if the originator and terminator are on the same line.

Datafill

Table	Description
RCCINV	A new field is added

A new field, ADNUM, is added to table RCCINV. This field holds the administrative number associated with a given PM.

NTXR88AA

AN0322

Operational measurements

A new OM group is created by this feature. OM group, NARUSAGE, collects each NAR defined in the office. NARUSAGE has three register, NARTOTAL, NARBLCKD, AND NARTRAF.

NTXR95AA

Name Display-TCAP

This feature package provides the transaction capabilities application part (TCAP) interface for Custom Local Area Signaling Service (CLASS) Calling Name Delivery. It also implements the call processing and application part of the residential Calling Name Delivery architecture.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTRX95AA contents	
Feature number	Description
AN0232	CLASS: TCAP for Calling Name Delivery
AN0323	CLASS Calling Name TR Compliancy-RES

BCS history

This feature package was created in BCS36.

Feature package number	Description
NTX550AA	CCS7-Transaction Service Support
NTXA64AA	Residential Enhanced Services (RES) Base
NTXA823AA	Class Line Office Data
NTXE52AA	Calling Name Delivery Switch Based

AN0232

Feature name

CLASS: TCAP for Calling Name Delivery

Description

This feature provides the transaction capabilities application part (TCAP) interface for Custom Local Area Signaling Service (CLASS) Calling Name Delivery.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature does not provide the TCAP procedures required to support the business group architecture described in Bellcore technical requirements TR-NWT-001188, *CLASS Calling Name Delivery Generic Requirements*. Neither the intelligent network 1 (IN/1), nor the Advanced Intelligent Network (AIN) release 0 business group switch procedures are provided. For the same reason, this feature does not support a different subsystem number and translation type for the business group architecture.

The software management system (SMS)-originated code control procedures and the manual code control procedures described in technical requirements specification TR-TSY-000402, *Additional Service Switching Point and Related End Office Capabilities*, are not supported by this feature.

If an error is encountered in a Calling Name Delivery (CNAMD) TCAP response package received from the centralized residence name database, the TCAP response package will be consumed. No reply will be sent to the centralized name database to indicate that the SSP encountered an error in the TCAP response package.

This feature does not provide the TCAP procedures required to support the transmittal of name information to an Automatic Callback (ACB) or Automatic Recall (AR) subscriber.

Feature interactions

This feature uses operational measurements from group CNAMD, provided in feature AN0323 (CLASS Calling Name TR Compliance - Residential).

Datafill

Table	Description
TCAPTRID	Value CNAMD added to field TCAPAPPL
C7GTT	CNAMD added as a valid subsystem name
C7LOCSSN	CNAMD added as a valid subsystem name
C7RPLSSN	CNAMD added as a valid subsystem name
C7GTTYPE	CNAMDGT added as a valid translation type

Logs

Three new log reports are created by this feature: TCAP 100, TCAP 101, and AUD 591.

A TCAP 100 log is generated for each TCAP response package that is returned from the centralized residence with a return error component.

A TCAP 101 log is generated for each TCAP QWP package returned in an SCCPUDTS package.

An AUD 591 log report is generated whenever a call traps or fails while holding a CNAMD TCAP extension block.

User interface

This feature creates a new CI command, CNAMDCG, to display the internally stored list of CNAMD ACG six-digit code controls at the MAP (maintenance and administration position).

AN0323

Feature name

CLASS Calling Name TR Compliance - Residential

Description

This feature implements the call processing and application part of the residential calling name delivery architecture. This architecture is described in Bellcore technical requirements TR-NWT-001188, *Custom Local Area Signaling Services (CLASS) Calling Name Delivery General Requirements*.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of the 6X51AB card (extended line concentrator module processor), and the 6X78AB card (CLASS modem resource card).

Restrictions and limitations

This feature is supported only on Residential Enhanced Services (RES) lines where transaction capabilities application part (TCAP) calling name applies. It is not supported in the Meridian Digital Centrex (MDC) environment

This feature does not address basic business group (BBG) or multiswitch business group (MBG) issues referenced in TR-NWT-001188.

Non-RES line class codes (LCC) in customer groups with the TCAPNM option datafilled in table CUSTNTWK will not receive information through TCAP queries. TCAP queries for calling name information are supported only by RES LCCs.

Calling name information is not delivered to the RES members of a MADN EXB group in which TCAPNM applies to the customer group. Calling name information is provided to non-RES lines of the MADN group using the proprietary method.

Calling name information is not delivered in the following situations:

- during the ringback phase of Automatic Call Back or Automatic Recall
- during Call Waiting ringback
- to the ringing party of a call transfer, if the TCAP query is pending when the call was transferred
- to the ringing party of a three-way call, if the TCAP query is pending when the three-way call was established

Feature interactions

This feature requires the TCAP interfaces provided by feature AN0232 (CLASS: TCAP for Calling Name Delivery).

Datafill

Table	Description
CUSTNTWK	OPTION TCAPNM ADDED
CUSTHEAD	Range of option NDTIMOUT changed from 1-3 to 1-6
RESFEAT	Meaning of counts "AVAIL" and "UNAVAIL" changed

The following two office parameters are added to table OFCVAR by this feature:

- TCAPNM_INTERLATA_QUERY
- TCAPNM_BLK_QUERY_PRIV_DNS

Operational measurements

This feature creates a new OM group, CNAMD. This group contains a total of 22 registers. Of these, 13 are new registers, the remaining 9 registers being CNAMD-specific registers moved from the CND group.

The following 13 registers are created by this feature:

- CNAMDEL indicates the number of times the name is transmitted to a CPE
- CNAMDEL2 indicates the number of times the name is transmitted to a CPE (overflow register for CNAMDEL)
- NANUMDEL indicates the number of times both the name and the number are delivered to a CPE
- NANUMDE2 indicates the number of times both the name and the number are delivered to a CPE (overflow register for NANUMDEL)
- CNAMPDEL indicates the number of times the private indication for the calling name is sent to a CPE
- CNAMODEL indicates the number of times an out-of-area indication for the calling name is sent to a CPE
- NAMTCPQ indicates the number of TCAP name queries launched toward a name database for RES lines
- NAMTCPQ2 indicates the number of TCAP name queries launched toward a name database for RES lines (overflow register for NAMTCPQ)

- NAMTCPTO indicates the number of TCAP timeouts that occurred when the switch was waiting for a response from the name database
- TRIDUAVL indicates the number of times a query was not initiated because transaction ID (TRID) was unavailable
- NAMACGBK indicates the number of times a query was blocked due to an active automatic call gapping (ACG) six-digit code control
- NAMACGOV indicates the number of times the SCP requested an ACG six-digit code control be applied, but the control could not be applied because of a full code control table
- NAMISPTO indicates the number of ISUP query timeouts that occurred when the switch was waiting for a response from the originating switch (applies to the proprietary architecture only)

Automatic message accounting

This feature establishes new billing requirements for the following cases:

- where CNAMD and CND are both assigned to a line as AMA (SUSP)
- where CNAMD and DDN are both assigned to a line as AMA (SUSP)

NTXS11AA

File Transfer Protocol (DARPA)

The feature package provides communication base services initially intended for second-generation service control point (SCPII) applications.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS11AA contents	
Feature number	Description
AL1693	File Transfer Client Interface for DMS-SCP II
AR0142	SuperNode File Transfer Provocol Phase 2

BCS history

This feature package was created in BCS34.

BCS36-AR0142 changed

Required feature packages

Required feature packages	
Feature package number	Description
NTXF05AA	Ethernet Interface Unit
NTXF19AA	TCP/IP Provocols

AR0142

Feature name

SuperNode File Transfer Protocol Phase 2

Description

AR0142 provides support for the following file transfer protocol (FTP) functionality:

- configurable number of FTP connections for each node
- security check
- absolute and relative pathnames
- reservation of client/server session in FTP

This feature belongs to the set of features that provide communication base services initially intended for applications based on the second-generation service control point (SCPII).

This feature provides user interfaces and a command interpreter (CI) for FTP client sessions.

BCS history

This feature was created in BCS34.

BCS36 Changed

Restrictions and limitations

There is a limit to the number of concurrent file transfers for a given node. The limit is determined by the number of FTP and transmission control protocol (TCP) connections.

The number of FTP connections should not be more than half of the total TCP connections.

There is a limit to the number of usernames. Usernames cannot be duplicated while recovering FTP server sessions.

Wild cards are not allowed in file names or pathnames.

Users are disconnected during login after being idle for 2 min or after three unsuccessful attempts.

Logs

This feature creates the following new logs:

- ITN 501 File transfer protocol login
- ITN 599 File transfer protocol summary

NTXS12AA

Digital Test Access for PRI

This feature package enables operating company personnel to monitor primary rate interface (PRI) primary or backup D-channels using digital test access (DTA). Digital test access is nonintrusive since the monitored data is broadcast to its normal destination and to the DTA endpoint.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS12AA contents	
Feature number	Description
AQ1018	DTA on PRI D-Channel (CC)

Required feature packages	
Feature package number	Description
NTX750AD	ISDN Basic Access
NTX790AC	ISDN-Primary Rate Access Base

AQ1018

Feature name

DTA on PRI D-Channel (CC)

Description

This feature enables operating company personnel to monitor primary rate interface (PRI) primary or backup D-channels using digital test access (DTA). DTA is nonintrusive since the monitored data is broadcast to its normal destination and to the DTA endpoint.

BCS history

This feature was created in BCS36.

Hardware requirements

The ISDN digital trunk controller (DTCI) /line trunk controller (LTC) supporting the PRI D-channel must be equipped with the following hardware:

- NTMX77AA unified processor circuit pack
- NTB01AB enhanced ISDN signaling processor card
- NT6X44 timeswitch

Restrictions and limitations

This feature supports only PRI D-channels on DTCI/LTC using DS-1 interface technology.

The system removes DTA connections at the time of a BCS application by an ONP pre-switch of activity (PRESWACT) step.

Feature interactions

This feature builds on the DTA features introduced by features AL1321 (ISDN Digital Test Access Maintenance), AL1320 (ISDN XPM Digital Test Access), and AQ0875 (DTA on ISLC Circuit Switched B-channel).

User interface

Two commands have been added to the trunk test position (TTP) level, PRADCH sublevel, of the MAP (maintenance and administration position). The EQUIP command allows DTA monitoring equipment to be reserved for DTA use. EQUIP also allows all of the data connections on the switch to be queried and allows the monitoring equipment to be released from reserve. The CONNECT command allows the monitoring equipment to connect to the PRI D-channel. CONNECT also allows DTA connections to be verified and released.

NTXS17AA

ISN CCS7 Interface

This feature package provides a Common Channel Signaling 7 (CCS7) interface to the intelligent services node, to implement

- a memory call management system for storage of the test results reported by the data call tester (DCT) network tool
- a user interface for the DCT network tool
- call processing of the DCT network tool

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS17AA contents	
Feature number	Description
AJ2887	DCT Call Processing
AJ2888	DCT MAPCI Modifications
AJ2889	DCT Memory Management for Test Results

BCS history

Either NTX881AB or NTX881AC or NTX882AA	Switch Bit Error Rate NTCE Switch Bit Error Rate Maintenance Bit Error Ratio Indicator for Toll Switches

AJ2887

Feature name

DCT Call Processing

Description

This feature implements the call processing aspect of the data call tester (DCT) network tool. It allows maintenance personnel to make data calls on a DMS switch between integrated bit error rate tester (IBERT) devices, between an IBERT device and an external bit error rate tester (BERT) device, or between an IBERT and a trunk loopback (TRKLPBK) circuit to run bit error rate tests. The data call is originated by user commands from the DCT level of the MAP (maintenance and administration position).

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of an IBERT line card (ILC) and a digital test unit (DTU).

Restrictions and limitations

This feature is supported only on the SuperNode version of the DMS-100, DMS-200, or the combined DMS-100/200 switches. This feature is not supported on the NT40 switch.

Intra-switch DTU to DTU, DTU to ILC, or ILC to DTU DCT calls are not supported.

A maximum of 20 concurrent DCT calls can be made on a DMS switch. This includes originating DCT calls, terminating DCT calls, and delayed calls.

The DCT class tuple in table FMRESUSE is always present, even if the DCT package is not present in the office.

On a DCTTERMBERT call that terminates normally, the last bin of the call at the terminating switch is always *out of synch*, because the network connection has already been dropped by the originating switch before the last bin is polled.

Operator calls using digit 0 are not supported by DCT. Table control for table DCTDIAL rejects any attempt to datafill a single 0 into field DN

Feature interactions

This feature interacts with the following features in order to function properly:

- AJ2888 DCT MAPCI Modification
- AJ2889 DCT Test Data Storage

Datafill

Table	Description
DCTDIAL	New table
DNIBERT	New table
FMREUSE	New tuple added to define a new application class for DCT
OFCVAR	Parameter DCT_TEST_CALL_SPILL added

Operational measurements

Extension block DCT is added to EXT OM by this feature.

Logs

A new log, AUD 592, is generated if the call dump occurs and the DCT extension block is present.

Automatic message accounting

The automatic message accounting (AMA) billing number is taken from office parameter DCT_TEST_CALL_SPILL in table OFCVAR.

AJ2888

Feature name

DCT MAPCI Modifications

Description

This feature implements the user interface for the data call tester (DCT) network tool. The DCT allows maintenance personnel to make data calls on a DMS switch between integrated bit error rate tester (IBERT) devices, between an IBERT device and an external bit error rate tester (BERT) device, or between an IBERT and a trunk loopback (TRKLPBK) circuit to run bit error rate tests. The data call is originated by user commands from the DCT level of the MAP (maintenance and administration position).

BCS history

This feature was created in BCS36.

Restrictions and limitations

The DCTTOOL command interpreter (CI) increment allows displaying and deleting of test results using a full screen. No other DCT functionality is accessible from this CI increment. DCTTOOL cannot be accessed from the DCT MAP levels.

Only one DIAL command at a time can be executed in any one testbook. If simultaneous dials are required, additional DIAL commands can be issued from other testbooks.

When testbook TERMRES0 or TERMRES1 is active, only commands DISPLAY, DELETE, INJECT, or TESTBOOK are valid.

For a specific MAP session, real-time errors can only be displayed for the current test of the active testbook. Also, if the same testbook is active on more than one MAP, only one of the MAP sessions can display real-time errors for the current test of that book.

Feature interactions

This feature provides the user interface for feature AJ2887 (DCT Call Processing) and feature AJ2889 (DCT Memory Management for Test Results). The three features together provide DCT functionality.

User interface

The DCT network tool is accessible from the DCT sublevels of both the line test position (LTP) and trunk test position (TTP) levels of the MAP. The DCT commands available at both sublevels are the same. DCTTOOL, a CI increment, is also provided to allow the display and deletion of test results.

Feature name

DCT Memory Management for Test Results

Description

This feature provides a memory call management system for storage of the test results reported by the data call tester (DCT) network tool. Bit error rate test (BERT) results related to a single trouble report are grouped together under a testbook supplied by the tester. The testbook identifier (ID) must be unique in an office, and testbook IDs TERMRES0 and TERMRES1 are reserved for DCT calls that terminate within the office. Within a testbook, each test is assigned a unique test number by the DCT application.

BCS history

This feature was created in BCS36.

Hardware requirements

The maximum amount of memory needed for DCT test results depends upon the number of days the results are kept, and also the number of concurrently running integrated BERTs (IBERT).

Restrictions and limitations

To minimize the number of bins needed, only bins in error are recorded.

On a reload restart all test results and testbooks are lost, and test numbers are reset to 1.

This feature does not support NT40 switches.

Test results are lost over a BCS upgrade (one night process).

Feature interactions

This feature works in conjunction with the following features to create DCT functionality:

- AJ2877 DCT Call Processing
- AJ2888 DCT MAPCI Modifications

Datafill

Table	Description
OFCENG	Parameter DCT_MEM_LIMIT added

NTXS18AA

TOPS Interchangeable NPA

This feature package enables Traffic Operator Position System (TOPS) call processing of interchangeable numbering plan area (NPA) format, thus permitting use of the expanded NPA range.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS18AA contents	
Feature number	Description

Feature package number	Description
NTX000AA	Bilge
NTX001AA	Common Basic
NTX030CC	TOPS Call Processing Features

AN0259

Feature name

TOPS Interchangeable NPA

Description

This feature modifies the Traffic Operator Position System (TOPS) to allow it to handle the interchangeable numbering plan area (NPA) format. This enables TOPS to use NPAs of format NXX, where N is in the range 2-9 and X is in the range 0-9. The changes include modifications to table control key types and checks, and to TOPS call processing where required to permit use of the expanded NPA range.

BCS history

This feature was created in BCS36.

Hardware requirements

Table control utilizes a dynamic store allocation scheme to allocate or deallocate data store as tuples are added to, or deleted from, the affected tables.

Restrictions and limitations

The ranges of the relevant keys and fields of the affected tables have been increased to encompass the interchangeable NPA (ICNPA) range. When this feature is present, the ICNPA range (NXX) can be datafilled in the relevant tables. If this feature is not present, then only NPA codes in the N 0/1 X range can be datafilled in the relevant tables.

Datafill

Table	Description
CARRTRF	Range of field CLGNPA changed to 200-999

AN0324

Feature name

TOPS DN Phase I

Description

This feature provides an infrastructure for a Traffic Operator Position System (TOPS) directory number (DN) database. The feature increases the number of restricted, coin, or hotel directory numbers that can be datafilled. It also provides the capability of modifying the automatic number identification (ANI) data that is sent to the carrier from restricted, coin, or hotel directory numbers. The limitation imposed by the maximum size of table SPLDNID (approximately 20 000 tuples) is removed.

BCS history

This feature was created in BCS36.

Hardware requirements

Additional memory may be required if a significant number of tuples are datafilled in table DNSCRN.

Feature interactions

This feature requires feature packages NTX030CC (TOPS Call Processing) and NTXV00 (DNSCRN Base).

Datafill

Table	Description
TOPSDB	New table
TDBCLASS	New table
DNSCRN	Attribute TOPSDB added

Logs

Log TRK118 is generated when there is difficulty receiving the ANI of the call.

NTXJ59AB or NTXJ59AC	CompCall Base Utilities

AR0215

Feature name

CompuCALL Agent Control Messenger

Description

This feature provides enhancements to the existing CompuCALL interface. It allows an external host computer to Log In or Log Out Automatic Call Distribution (ACD) agents through Switch Computer Application Interface (SCAI) signalling. It also allows the host computer to request an ACD agent be made Not Ready or Ready to receive ACD calls through SCAI. These are provided through new Extended Call Management (ECM) application message.

BCS history

This feature was created in BCS36.

Restrictions and limitations

ACD Agent Position Login

When logging in a 2500 set ACD agent position through CompuCALL, the line state of the agent terminal must be idle. When logging in to an MBS ACD agent position through CompuCALL, the InCalls Key (ICK) of the agent position must be idle.

ACD Agent Position Ready/Not Ready

When requesting an ACD agent position be made available or not available to receive incoming ACD calls through a CompuCALL Ready or Not Ready request, the agent position must be logged in. The INCALLS key of MBS ACD agent positions must be idle or active in a call. For the line state of 2500 set ACD agent positions must be idle or active in a call. In addition, the agent terminal must have the ACDNR feature datafilled in order to be able to make a CompuCALL Ready/Not Ready request. If the NR feature is not datafilled, a Return Error (RE) of "Invalid-Line-Configuration: will be returned to the host.

ACD Call Transfer or Call Park Recalls

Since activation of Not Ready is disallowed during a recall of a transferred or parked call, a Return Error of "Invalid-Agtpos-State" is returned to the host when a CompuCALL Not Ready request is received during a recall of a transferred or parked call.

Meridian Business Set (MBS) Display

A LogIn Request through CompuCALL will not display the Login ID, nor the password entered by the ACD agent position. The walkaway Reason entered by the agent in the Not Ready CompuCALL request will also not be displayed on the agent terminal.

Supervisor Position ID vs Agent Position ID

It is important to note an ACD agent position that is also a supervisor position can only log in through CompuCALL using the Position ID associated with the agent position, not with the Position ID associated with the supervisor position (if there is one).

High Traffic Volume

If many dv-SET-FEATURE RO requests are made within a short period of time, the performance of the ACD agent terminals as well as the performance of the host computers may be adversely affected due to the high volume of traffic generated.

Feature interactions

CompuCALL vs. Agent Terminal Feature Activations

The ACD LogIn/LogOut and ACD Not Ready /(Ready) features can be activated from the agent terminal or through CompuCALL dv-SET-FEATURE RO.

ACD Management Information System (MIS)

All activations of ACD LogIn/LogOut and ACD Ready/Not Ready by the CompuCALL dv-SET-FEATURE message interact with the MIS in the same manner as if the features had been activated through the agent terminal. No new ACD MIS messages are added to the MIS interface and all the existing ACD MIS messages are sent as required to fully support ACD MIS functionality.

Optionality of Password

There are two levels of password optionality-base DMS table control and CompuCALL subscription.

Optionality of WALKAWAY feature

WALKAWAY through CompuCALL is available to ACD agents independent of terminal type. The only restriction being the ACD group the ACD agent belongs to has MIS and the group subscribes to the CompuCALL WalkawayReason parameter in the dv-SET-FEATURE noReady RO.

Variable Wrap-Up vs. CompuCALL Ready/Not Ready

The Variable Wrap-up (VARWRAP) feature can be considered an extension of the previous ACD call, which allows the ACD agent to do follow-up work on the call.

InCalls Key on Hold vs. CompuCALL Not Ready

Presently, due to agent MBS terminal limitations, a Not Ready keyhit is ignored if the ICK key is in the held state. CompuCALL has no such

restriction, therefore, a Not Ready CompuCALL request will be accepted and processed if the agent is talking to an attendant console.

Attendant Console vs. CompuCALL Ready/Not Ready

Presently a Not Ready keyhit on an MBS set ACD terminal is ignored while the agent is talking to an Attendant Console (AC). CompuCALL has no such restriction, therefore, a Not Ready CompuCALL request will be accepted and processed if the agent is talking to an attendant console.

Datafill

Table	Description
SCAISSRV	Table modified

The table SCAISSRV is modified by this feature as follows:

- A new category, Third Party Agent Control (TCAP), is added to the last of CompuCALL service categories. Four service functions belong to this category: LOGIN, LOGOUT, READY and NOT-READY.
- Four event messages are added to the existing ACDEVENT category: dv-AGENT-LOGGED-IN-U, dv-AGENT-LOGGED-OUT-U, dv-AGENT-READY-U, and dv-AGENT-NOT-READY-U.

The following office parameter is introduced by this feature in table OFCSTD:

- MA_NUM_ECM_TPAC. This parameter, together with the previously defined CompuCALL Pricing control Office parameters, governs CompuCALL usage in a given DMS-100. Its default value is the minimum value, zero. It is set and modified by Northern Telecom. No restart is required if the parameter value is changed.

Operational measurements

There are six new operational measurements added to the OM group SCAISERV which are AGLDINU, AGLDOUTU, AGRDYU, AGNRDYU, INREJ and OUTREJ.

This feature introduces a new OM group, SCAISRV2, which consists of nine new operational measurements: SETFTRRE, LINAGRR, LINAGRE, LOUAGRR, LOUAGRE, RDYAGRR, RDYAGRE, NRDYAGRR, and NRDYAGRE

This feature package provides the base and maintenance software needed to support dialable wideband services (DWS) functionality on ISUP-, ISDN-, and CCS7-based trunks.

This feature package applies to DMS-100 offices.

Feature name

Network Management with DWS

Description

This feature enhances network management control for trunks datafilled to use dialable wideband services (DWS).

BCS history

This feature was created in BCS36.

Restrictions and limitations

Any time that a wideband call is alternate routed, a wideband trunk group must be in the alternate route list in order for the call to complete.

Feature interactions

This feature interacts with all calls made on wideband trunk groups when one or more of the network management controls are active.

AD4751

Feature name

DWS Trunk Audit I

Description

This feature implements a dialable wideband services (DWS) trunk queue audit. This ensures the integrity of the DWS trunk queue data structures.

BCS history

This feature was created in BCS36.

Logs

Four logs are created by this feature. These logs are generated when discrepancies are identified as a result of the wideband audit, as follows:

- **WB106. Conflicting Trunk State.** This is generated when a discrepancy is found between the trunk state in the internal wideband data structures and the actual trunk state as determined by the trunk audit
- **WB107. Conflicting Max Avail.** This is generated when a discrepancy is found between the maximum available bandwidth for this carrier in the internal wideband data structures and the actual maximum available bandwidth for this carrier as calculated by the wideband audit.
- **WB108. Conflicting Avail Band BM.** This is generated when a discrepancy is found between the available bandwidth bitmap stored in the internal wideband data structures and the actual available bandwidth bitmap calculated by the wideband audit for this carrier
- **WB109. Conflicting Max Trkgrp.** This is generated when a discrepancy is found between the maximum available bandwidth for this trunk group in the internal wideband data structures and the actual maximum available bandwidth for this trunk group as calculated by the wideband audit

Feature name

DWS DTCI XPM PLUS

Description

This feature verifies the interoperability between dialable wideband services (DWS) and the extended multiprocessor system (XMS)-based peripheral module (XPM) peripheral live upgrade strategy (PLUS) for the ISDN digital trunk controller (DTCI).

BCS history

This feature was created in BCS36.

Hardware requirements

For this feature, the DTCI must be upgraded to support XPM PLUS.

The enhanced network (ENET) is required to provide constant delay among all the wideband DS-0 channels across the switching network.

The DTCI must be equipped with an NTAX78AA card (digital cellular time switch card). This provides a constant delay across the DTCI.

This feature requires a 6X50AB card (DS-1 EFF card), revision 67 or later.

Restrictions and limitations

This feature applies only to DTCIs with XPM PLUS.

DTCIs support North American PRI protocol messaging.

AD4756

Feature name

DWS DTC7 XPM PLUS

Description

This feature verifies the interoperability between dialable wideband services (DWS) and the extended multiprocessor system (XMS)-based peripheral module (XPM) peripheral live upgrade strategy (PLUS) for the CCS7 digital trunk controller (DTC7).

BCS history

This feature was created in BCS36.

Hardware requirements

For this feature, the DTCI must be upgraded to support XPM PLUS.

The enhanced network (ENET) is required to provide constant delay among all the wideband DS-0 channels across the switching network.

The DTCI must be equipped with an NTAX78AA card (digital cellular time switch card). This provides a constant delay across the DTCI.

This feature requires a 6X50AB card (DS-1 EFF card), revision 67 or later.

Restrictions and limitations

This feature is intended for DTC7s supporting XPM PLUS upgrade only.

DTC7s currently support DWS over trunks with ISDN user part intertoll (ISUP-IT) protocol messaging.

Feature name

DWS XPM PLUS Overload Controls

Description

This activity enhances the extended multiprocessor system (XMS)-based peripheral module (XPM) peripheral life upgrade strategy (PLUS) overload controls for ISDN digital trunk controllers and digital trunk controllers with CCS7 software in order to handle dialable wideband services (DWS).

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires XPM PLUS.

Restrictions and limitations

This feature applies only to XPM PLUS.

Operational measurements

Under conditions of severe overload, this feature may ignore origination messages.

NTXS30AA

UAE/UNIX Conversant Software

This feature package provides software to extend SuperNode computing module operations in a UNIX application environment (UAE), including

- access to UNIX file systems hosted on the system load module or the input/output controller disks
- transfer of operational measurements and logs
- loadbuilding of the UNIX components of Automated Directory Assistance Service (ADAS)

This feature package applies to DMS-100 offices.

Feature package contents

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXS29AA	APU Maintenance

AF2980

Feature name

OM Transmission

Description

This feature integrates operational measurements (OM) from the UNIX application environment (UAE) on an application processing unit (APU) into the DMS OM system. The DMS OM system resides in the DMS SuperNode computing module (CM).

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires a SuperNode switch with a link peripheral processor (LPP) installed. The LPP should have at least one application processor unit (APU) with the UAE load.

Restrictions and limitations

When the APU on which the central OM receiver resides is busied, communication between the CM and that particular APU is not possible. Any OMs that were present on the APU are lost.

The OM data is transferred from the central OM receiver to the DMS OM system a minute before the DMS OM system transfers its ACTIVE registers to its HOLDING registers. At transfer time, if the APU on which the central OM receiver resides is overloaded, or the UAE/SOS OM interface process does not have time to run, the OM data may not be transferred within the time window. However, the data is not lost. Instead, the current ACTIVE register on the DMS OM system is updated. This results in a slight skew in the reporting of the OM data.

If OMSHOW is used on the CM to display the registers for UAE OM groups, then only the HOLDING registers will be valid. This is due to the OM data being transferred into the ACTIVE registers on the CM a minute before they become the HOLDING registers. Until that transfer the ACTIVE registers will have zero values. An exception to this is the situation where the one-minute transfer period is missed completely, in which case the new ACTIVE registers receive the OM data. Once the OM group is allocated, or tuples reallocated, there is no way to deallocate the memory space, other than with a restart.

The key IDs name must be not more than eight characters long.

If a register overflows at the CM, then any extension register associated with the register on the central OM receiver is not incremented.

Feature interactions

This feature interacts with the following features:

- AF2976 UAE Collector Enhancement for OM Collection
- AL1982 MTS Messaging Access for UNIX Applications on SNIX Nodes

Logs

The following six logs have been created for this feature:

- OMX101 generated when the UNIX OM transfer process on the CM receives an OM data message from a central OM receiver, containing bad data
- OMX102 generated when the UNIX OM transfer process on the CM attempts to allocate memory to store OM group data and fails
- UOAM300 generated when the COMR process cannot send a connection message to the USOMI process on the CM
- UOAM301 generated when the COMR attempts to send OMs to the CM, but is unable to do so
- UOAM302 generated when the APUX is unable to re-send either a data message or a connection message to the CM
- UOAM503 generated when the COMR on an APU has successfully established communications with the USOMI process on the CM

AF3379

Feature name

SuperNode/UNIX File System Access to SLM/SLMII/IOC

Description

This feature provides SuperNode UNIX (SNIX) applications access to disks based on the computing module (CM). SNIX applications may now use UNIX file systems hosted on the system load module (SLM), or the input/output controller (IOC) disks, and access them from a SNIX node. The feature allows for a maximum of 16 SNIX file systems, and also supports file shadowing, which provides increased reliability in the host SNIX distributed file system (HSDF).

BCS history

This feature was created in BCS36.

Hardware requirements

This feature is intended for a SuperNode switch. The switch must have at least a system load module (SLM), or an input/output controller (IOC) disk as well as an applications processor unit (APU) running SuperNode UNIX.

Restrictions and limitations

The Support Operating System (SOS) will not interwork with UNIX files, as the UNIX file system structure is hidden within the contents of an SOS file.

An HSDF read/write volume is dependent upon an owner SNIX node.

The DISKUT BACKUP facility will support only the backup of HSDF read-only files. DISKUT BACKUP does not support the backup of HSDF read/write files.

The HSDF system has a limit of 16 file systems.

It is strongly recommended that the SOS files for the HSDF be placed on SLM devices for greater performance.

Feature interactions

This feature interacts with existing SNIX and message transport system (MTS) base software, and with the file and cache systems within the UNIX kernel.

Datafill

Table	Description
SNIXVOLS	New table
SNIXAPPL	New table
LIUINV	Change of LIU-type to APU, removal of subfields SOSTIX and SNIXTIX
IPHOST	Node name changed from APUX to APU
SNIXINFO	Changed to allow APUs to be datafilled

Logs

This feature creates the following logs:

- HSDF301 file access failure
- HSDF302 file system access failure
- HSDF501 state change
- HSDF502 configuration change

AF3391

Feature name

Logs Transfer - UNIX-SOS

Description

This feature provides a distributed mechanism for collecting and transferring logs between Support Operating System (SOS)-based nodes. The messages are received from the UNIX application environment (UAE) data collector and the UNIX system log (Syslog) utility, and are then inserted into the DMS log system.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature functions on any node that runs the SuperNode/UNIX (SNIX) environment.

Restrictions and limitations

This feature does not maintain all of the information from a UAE log report to the generated SOS log report. However, the lost information has no relevance to the DMS log system. For example, the UNIX node name is not transferred, but this becomes irrelevant in the DMS environment.

Because all syslogs are mapped to USLG100, it is not possible to apply thresholds or to suppress Syslogs from different applications that generate logs.

This feature does not check the `/etc/syslog.conf` file to verify that it is causing the Syslogs to be sent to the appropriate pipes. Currently, however, there is no requirement for this functionality.

Feature interactions

This feature interacts with the SOS log system, the UAE data collector, and the UNIX Syslog system.

Logs

This feature creates the following five new logs:

- USLG100 Generated when a Syslog is generated on a SOS/SNIX node
- USLG101 Generated when the Syslog receiver on a SOS/SNIX node receives an improperly formatted Syslog
- USLG102 Generated when the ltr program, that starts various log receivers, is started with invalid parameters
- USLG103 Generated when the /etc/syslog.conf file on a SOS/SNIX node does not reference all of the buffers used for log transfer
- USLG104 Generated when the UNIX log transfer process detects that the Syslog daemon has stopped execution

AN0069

Feature name

ADAS UNIX Loadbuild and Software Installation

Description

This feature provides a loadbuilding process for the UNIX components of the Automated Directory Assistance Service (ADAS). This includes the ADAS application that resides on an application processor running SuperNode UNIX (APU), as well as on a Hewlett-Packard workstation. The feature also modifies the workstation manager component of the UNIX application environment base, and outlines the APU software installation process.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of two cards: NTEX22BA (integrated processor and F-bus interface card) and NT9X14DB (24-Mbyte memory card). These cards together make up the APU, and occupy two slots of a link peripheral processor (LPP) cabinet.

Restrictions and limitations

This feature enforces a naming convention on future applications that run on an APU.

Feature interactions

This feature interacts with the following features:

- AF3379 SuperNode/UNIX File System Access
- AJ0322 IWS Manager
- AJ0839 Binary Elector
- AL2010 APU Maintenance, Phase II

Logs

This feature generates logs if any of the following events occur:

- An installation process is unable to locate necessary files or configuration data
- The configuration data obtained from SNIXAPPL contains invalid data
- An installation process is terminated abnormally
- Either the application process or workstation manager (WSM) cannot be started
- Necessary links needed to access the ADAS load could not be established on the CM

Enhanced Service Resource Management

This feature package provides enhanced service resource management (ESRM) services including

- the configuration and allocation of voice processing units (VPU)
- the ability to datafill and assign services to VPU nodes
- call processing, common maintenance, and data transfer functions for Automated Directory Assistance Service (ADAS) in a UNIX environment

This feature package applies to DMS-100 offices.

Feature package contents

AN0178	ADAS MMI Data Transfer

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXS11AA	File Transfer Protocol (DARPA)
NTXS30AA	UAE/UNIX Conversant Software

AF3006

Feature name

VPU Service Circuit Resource Management

Description

This feature coordinates the configuration of voice processing units (VPU) and the allocation of VPU service circuits to applications. It also provides the mechanism to notify the application of VPU faults.

BCS history

This feature was created in BCS36.

Restrictions and limitations

There is a limit of 720 network channels provided by NIU nodes in an office. These channels are a shared resource for VPU service circuits and any other APU-based application that requires network access through an NIU.

This feature does not include a resource audit. All resources are initially allocated by way of the enhanced services resource manager (ESRM), which implements its own audit.

Feature interactions

This feature interacts with the following features:

- AF3007 VPU Service Circuit Processing
- AF3532 VPU MAP and Table Control
- AI0273 Generic LIU Maintenance
- AI0410 Network Interface Unit (NIU) Central Maintenance
- AN0047 Enhanced Services Resource Manager

Operational measurements

This feature creates a new operational measurements (OM) group, VPSC. This group contains the following eight registers:

- VPSCSZR indicates the total number of service circuits that have been allocated on the VPU
- VPSCMAX indicates the maximum number of service circuits that were allocated on the VPU at any one time
- VPSCUSE is incremented every 10 s by the number of service circuits in use at that time
- VPSCMTC is incremented every 10 s by the number of unavailable service circuits
- VPSCIDL is incremented every 10 s by the number of available but unallocated service circuits

-
- **VPSCMIS** indicates the total number of service circuit session mismatches detected by the VPU
 - **VPSCAUD** indicates the total number of service circuits that have been reclaimed by audit
 - **VPSCFLT** indicates the total number of service circuits that were in use when they suffered a service-affecting fault

AF3049

Feature name

ADAS APUX Resource Management

Description

The Automated Directory Assistance Service (ADAS) application processor running SuperNode UNIX (APUX) resource manager (AARM) is a software entity that resides on the computing module (CM) of the DMS system. It is used by maintenance applications and, through its interface with the enhanced services resource manager (ESRM), by call processing. AARM defines, allocates, deallocates, and performs common maintenance functions on APUX-based call processing engine (CPE) service circuits.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Changes to the capacity of an application node through table control in table SNIXAPPL are not reflected in the OM display for APU-based advanced services (AASV) until after the next restart.

Feature interactions

This feature interacts with the following features:

- AF2989 Channel Performance Monitor
- AF3291 APUX Process Manager
- AF3382 ADAS Data Manager
- AI0273 Generic LIU Maintenance
- AN0047 Enhanced Services Resource Manager
- AN0056 ADAS Service Data MMI
- AN0162 ADAS UN*X Loadbuild and Software Installation

Datafill

Table	Description
ESRVATTR	Field SRVDATA added

Operational measurements

This feature creates a new operational measurements (OM) group, AASV. This group gathers information on APU service circuit availability and usage on the basis of each APU.

Group AASV consists of the following registers:

- AASVALOC counts the number of allocations
- AASVHWM counts the highest number of simultaneous calls
- AASVTRAF counts the call traffic
- AASVUNAV counts unavailable channels
- AASVIDLE counts channels not in use
- AASVFLT counts the number of channel failures
- AASVSFLT counts the number of APU service data synchronization failures

AF3532

Feature name

VPU MAP and Table Control

Description

This feature provides maintenance personnel with the ability to datafill voice processing unit (VPU) nodes in table LIUINV, and to assign services to these nodes by means of table VPUSERV. This feature also defines the VPU MAP (maintenance and administration position) as a sub-level of the peripheral module MAP.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the following cards:

- NTEX22BB integrated processor and F-bus card
- NTMX97AA recording-announcement processor card
- NTMX99AA C-bus interface, 512-channel paddle board

Restrictions and limitations

VPU nodes operate only in simplex mode. There is no “warm” sparing.

A maximum of 180 VPU nodes can be used in a single office.

Feature interactions

This feature interacts with the following features in the manner indicated:

- AI0273 Generic LIU Maintenance. Provides the central maintenance base for all application specific units (ASU)
- AI0410 NIU Central Maintenance. VPU table control registers the VPU with the NIU channel database to enable subsequent channel allocation
- AF3005 VPU Local Maintenance. Implements some of the maintenance commands initiated from the VPU MAP

Datafill

Table	Description
LIUINV	ASU type VPU added
VPSRVDEF	New table
VPUSERV	New table

Operational measurements

The following PM1 registers are associated with the VPU:

- **PM1ERR** Indicates the number of VPU state mismatches, test failures and in-service (Insv) to in-service trouble (Istb) PM-state transitions
- **PM1FLT** Indicates the number of VPU autonomous fault reports
- **PM1INITS** Indicates the number of VPU restarts
- **PM1LOAD** Indicates the number of VPU load operations
- **PM1MBU** Indicates the number of manual busy (ManB) VPUs
- **PM1SBU** Indicates the number of system busy (SysB) VPUs

User interface

This feature creates a new PM Map level, VPU. Seven new commands have been created and 15 commands have been changed to allow their usage with the VPU node type.

The following are the new commands:

- **TST** Run diagnostics on the posted VPU peripheral
- **BSY** Manually busy the selected VPUs
- **RTS** Return the specified VPU to service
- **OFFL** Place the specified VPU in the offline state
- **LOADPM** Load the currently posted VPUs
- **QUERYPM** Display miscellaneous engineering and PM status information
- **PMRESET** Reset the specified VPU

AN0047

Feature name

Enhanced Services Resource Management

Description

This feature provides enhanced services resource management (ESRM) with a distributed resource management (DRM)-compliant interface. The ESRM is used by call processing and maintenance applications to define, allocate, deallocate and perform common maintenance functions on Automated Directory Assistance Service (ADAS) circuits.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Operating company personnel can read, but not alter, tables ESRVATTR and ESRVCAP.

The following limitations apply to the implementation of the ESRM with this feature:

- The facility for binding in failure callback procedures is not implemented
- Queries and registrations for ADAS service circuit component instances are not supported

Feature interactions

This feature interacts with the following features:

- AF3006 VPU Service Circuit Resource Management
- AF3049 ADAS APUX Resource Management
- AF3205 ADAS VSN XP
- AF3206 ADAS TOPS XP
- AF3381 APUX Process Management
- AN0056 ADAS Service Data MMI

Datafill

Table	Description
ESRVATTR	New table

Feature name

ADAS MMI Data Transfer

Description

This feature provides a data transfer process for the Automated Directory Assistance Service (ADAS) man-machine interface (MMI). ADAS service data can be transferred from a workstation to a SuperNode load module (SLM) disk. The data can then be retrieved and used by ADAS service components, such as call processing engines (CPE) or voice processing units (VPU). This feature also manages the interactions involved in notifying the enhanced services resource management (ESRM) of service updates.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature is installed on the operations, administration, maintenance, and provisioning (OAM&P) workstation. This is an HP 7XX-series workstation, running UN*X and UAE base software. A local area network (LAN) connection is required to allow the workstation to communicate with the computing module (CM) over an Ethernet link. An ethernet interface unit (EIU) is also required.

Feature interactions

This feature interacts with the following features:

- AF3006 VPU Service Circuit Resource Management
- AF3049 ADAS APUX Resource Management
- AI0302 UAE Multinodal Interprocess Communication
- AN0047 Enhanced Services Resource Management
- AN0056 ADAS Service Data MMI
- AR0142 SuperNode File Transfer

NTXS32AA

APU SOS/UNIX Base

This feature package implements SuperNode/UNIX base functions including

- transfer of Automated Directory Assistance Service (ADAS) logs to the support operating system (SOS)
- memory allocation, shutdown, and reboot protocols
- virtual machine scheduling of UNIX applications and support of SuperNode/UN*X on the file processor platform

This feature package applies to DMS-100 offices.

Feature package number	Description
NTXS30AA	UAE/UNIX Conversant Software

NTXS32AA

AF2684

Feature name

UNIX Kernel Changes for SuperNode/UNIX Phase 2

Description

This feature implements three changes to the UNIX operating system HP-UX to create part of the SuperNode/UNIX software:

- improved memory allocation
- floating point emulation
- graduated shutdown and warm reboot process for UNIX

BCS history

This feature was created in BCS36.

Feature name

Logs and Alarms Transfer (Receiver) - UNIX-SOS

Description

This feature provides a base receiver to receive the Automated Directory Assistance Service (ADAS) logs from the data collector and to prepare them for transfer to the support operating system (SOS) log system. System logs (Syslogs) do not go through the data collector, but can indicate serious problems. A process is also established for collecting these logs and formatting them in preparation for sending to the SOS log system.

BCS history

This feature was created in BCS36.

Restrictions and limitations

If the syslog configuration file is incorrect, but still references all of the eight buffer files, incoming logs could be placed into the incorrect syslog buffer files. If this occurs, the feature does not generate an entry in the xferlogs file.

AL2016

Feature name

Enhanced VM Scheduler

Description

This feature enhances the virtual machine (VM) scheduling mechanism to provide fair-share scheduling for UNIX applications. This is applied over the existing priority-based UNIX scheduler. The VM fair-share classes are scheduled in the usual manner by the Support Operating System (SOS) fair-share scheduler, thereby merging behavior and characteristics of the two schedulers.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The SOS scheduler consumes a larger portion of the CPU when the VM fair-share classes are enabled.

This feature is not integrated with other SOS applications. In particular, it defines a part of the scheduler that is specific to APUX, APX, and FPX nodes.

User interface

The VM fair-share classes appear in the ANALYSIS tool as VM1, VM2, and VM3. Any processes performed within these classes also appear in the CPSTATUS tool, within the FORE category.

Feature name

FPX VM Modifications

Description

This feature completes the virtual machine (VM) modifications required to support SuperNode/UN*X on the file processor (FP) platform. It provides support for an FP controlled by a dual operating system, SOS and UN*X. Some parts of this feature also apply to the application processor (APX) and to the application processor unit (APUX).

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the standard file processor (FP) and application processor (AP) hardware.

Restrictions and limitations

This feature provides a transparent environment, so that both operating systems (SOS and UNIX) behave as if each one is the sole operating system.

Logs

This feature creates the following two logs:

- SNIX107 SNIX no ip address
- SNIX108 SNIX kernel log

NTXS37AA

AABS Enhanced Services Access

This feature package implements upgrades to the Traffic Operator Position System (TOPS) computing module to provide message delivery service selection for third-number and calling-card calls that have been transferred to Automated Alternate Billing Service (AABS), and for routing of these calls to automated services or to an operator or agent.

This feature package applies to DMS-100 offices.

NTXR48AA	QMS: Call and Agent Manager
NTXR52AA	TOPS Increased Multiplexing

AF5009

Feature name

TOPS Enhancements for MDS

Description

This feature implements enhancements to the Traffic Operator Position System (TOPS) computing module (CM) . This provides message delivery service (MDS) selection for collect, third number and calling card calls that have been handled by the Alternate Automated Billing Service (AABS), and for routing of these calls to automated or live MDS operators or agents.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature is intended for use in a specific market area for a limited period of time only. It is not intended for general application.

In order to avoid possible problems with equal access, MDS should be offered only for calls within a local access and transport area (intra-LATA).

On third-number calls, a 3-port connector is attached during billing acceptance verification. If direct network connections cannot be set up, the 3-port connector is not released. Under these circumstances the DMS switch does not monitor the call for MDS selection.

Calls arriving on trunks designated QMSCAM in table TOPSTOPT are the only calls eligible for MDS handling.

Feature interactions

This feature is provided only if AABS base is installed.

For routing, this feature requires the queue management system. Either of feature packages NTP41AA (TOPS Host/Standalone QMS) or NTP42AA (TOPS Remote QMS) must be installed.

Automated MDS operators require the open position protocol (OPP).

Datafill

Table	Description
MDSACTN	New table
MDSLANG	New table

Table	Description
TOPSLANG	Crosscheck added to table control to prevent deletion of any language that is datafilled in table MDSLANG or MDSACTN
TOPSPARM	Parameter AUTO_MDS_QMS_CQPROF added

Link Sectionalization Capabilities

This feature package enables the NT9X78 card (enhanced DS-0 interface paddle board) to generate DS-0 loopback codes so that the software can implement CCS7 link fault sectionalization.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS51AA contents	
Feature number	Description
AR0540	FW Support for CCS7 Link Fault Sectionalization

NTX839AB	LPP-Enhanced Maintenance and BERT (replaces NTX839AA)
NTXN19AA	LIU7 for LPP-based CCS7 Applications
NTXR72AA	CCS7 MTP/SCCP for LPP-based Platforms

AR0540

Feature name

FW Support for CCS7 Link Fault Sectionalization

Description

This feature provides the necessary firmware for the NT9X78DA card (DS-0A interface paddleboard) to generate DS-0 loopback codes so that the software can implement Common Channel Signaling 7 (CCS7) link fault sectionalization.

BCS history

This feature was created in BCS36.

Hardware requirements

The NT9X78DA card (enhanced DS-0A interface paddle board) is created as part of this feature. This unit is backwards compatible with current hardware.

Restrictions and limitations

The NT9X78DA card cannot be used with pre-BCS35 software.

With BCS35 software the NT9X78DA card can be used only in a signal transfer point (STP).

In cases where the hardware along the CCS7 signaling link does not support control of loopback by link fault sectionalization (LFS) control codes, it is assumed that the control codes are passed transparently along to the next network element.

Feature interactions

This feature is required by feature AR0518 (CCS7 Link Fault Sectionalization) to facilitate LFS maintenance procedures.

This feature requires feature AR0518 to provide user interface for its new functionality, as well as to signal to the software that it is compatible with previous NT9X78 hardware issues.

NTXS64AA

RSC-S Enhanced ESA (Lines Only)

This feature package supports emergency stand-alone (ESA) call processing for intra-ISDN calls on remote cluster controller 2 (RCC2), dual RCC2, and extended multiprocessor system (XMS)-based peripheral modules (XPM).

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS64AA contents	
Feature number	Description
AF4893	RCC2 ISDN Warm Entry, Exit-CC
AF4894	RCC2 ISDN Warm Entry, Exit-XPM
AF4895	RCC2 ISDN Warm Entry, Exit for ISDN Call

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXP92AB	RSC-S Basic (upgrade of NTP92AA)
NTXQ12AA	RSC Enhanced ESA (Lines Only)

AF4893

Feature name

RCC2 ISDN Warm Entry/Exit - CC

Description

This feature provides central controller (CC) call processing changes for emergency stand-alone (ESA) warm entry and exit on intra-ISDN calls on remote cluster controller 2 (RCC2).

This feature uses two packages for remote switching center-SONET (RSC-S) enhanced ESA. For ISDN lines only, package NTXQ12AA (RSC enhanced ESA [lines only]) is required. For ISDN lines and trunks package NTXN82AB (RSC enhanced ESA [lines and trunks]) is required.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature supports RCC2 only.

This feature does not support features and hardware that are not supported by RCC2.

This feature does not support ISDN dual RCC2 warm ESA entry and exit.

Feature activation is not supported on calls surviving ESA warm entry and exit.

Generic services framework (GSF) calls are not supported over cold or warm entry, cold or warm exit, or during ESA.

For warm exit, dial tone is restored as soon as possible, usually within seconds. The actual dial tone delay depends on many factors, such as the call mix, occupancy of the CC RCC2 and host extended multiprocessor system (XMS)-based peripheral module (XPM) CPUs, or the distance of the RCC2 from the host XPM.

Feature interactions

This feature requires feature AF4894 (RCC2 ISDN Warm Entry/Exit - XPM) in order to function.

Feature AF4895 (Dual RCC2 Warm Entry/Exit for ISDN Calls) requires this feature in order to function.

Feature name

RCC2 ISDN Warm Entry/Exit - XPM

Description

This feature implements extended multiprocessor system (XMS)-based peripheral module (XPM) call processing changes for emergency stand-alone (ESA) warm entry for ISDN intraswitch calls. It also provides the ESA reports on the ISDN calls.

This feature uses two packages for remote switching center-SONET (RSC-S) enhanced ESA. For ISDN lines only, package NTXQ12AA (RSC enhanced ESA [lines only]) is required. For ISDN lines and trunks package NTXN82AB (RSC enhanced ESA [lines and trunks]) is required.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature supports RCC2 only.

This feature does not support features and hardware that are not supported by RCC2.

This feature does not support ISDN dual RCC2 warm ESA entry and exit.

Feature activation is not supported on calls surviving ESA warm entry and exit.

Generic services framework (GSF) calls are not supported over cold or warm entry, cold or warm exit, or during ESA.

For warm exit, dial tone is restored as soon as possible, usually within seconds. The actual dial tone delay depends on many factors, such as the call mix, occupancy of the CC RCC2 and host XPM CPUs, or the distance of the RCC2 from the host XPM.

Feature interactions

This feature requires feature AF4893 (RCC2 ISDN Warm Entry/Exit - CC) in order to function.

Feature AF4895 (Dual RCC2 Warm Entry/Exit for ISDN Calls) requires this feature in order to function.

AF4895

Feature name

Dual RCC2 Warm Entry/Exit for ISDN Calls

Description

This feature provides support for ISDN calls on dual remote cluster controller 2 (DRCC2) emergency stand-alone (ESA) warm entry and exit.

This feature uses two packages for remote switching center-SONET (RSC-S) enhanced ESA. For ISDN lines only, package NTXQ12AA (RSC enhanced ESA [lines only]) is required. For ISDN lines and trunks package NTXN82AB (RSC enhanced ESA [lines and trunks]) is required.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature supports single RCC2 and dual RCC2 only.

This feature does not support features and hardware that are not supported by RCC2.

Feature activation is not supported on calls surviving ESA warm entry and exit.

Generic services framework (GSF) calls are not supported over cold or warm entry, cold or warm exit, or during ESA.

For warm exit, dial tone is restored as soon as possible, usually within seconds. The actual dial tone delay depends on many factors, such as the call mix, occupancy of the CC RCC2 and host extended multiprocessor system (XMS)-based peripheral module (XPM) CPUs, or the distance of the RCC2 from the host XPM.

Feature interactions

This feature requires features AF4893 (RCC2 ISDN Warm Entry/Exit - CC) and AF4894 ((RCC2 ISDN Warm Entry/Exit - XPM) in order to function.

NTXS65AA

RSC-S Enhanced ESA (Lines and Trunks)

This feature package supports emergency stand-alone (ESA) call processing for intra-ISDN calls on remote cluster controller 2 (RCC2), dual RCC2, and extended multiprocessor system (XMS)-based peripheral modules (XPM).

This feature package applies to DMS-100 offices.

Feature package contents

AF4893

Feature name

RCC2 ISDN Warm Entry/Exit - CC

Description

This feature provides central controller (CC) call processing changes for emergency stand-alone (ESA) warm entry and exit on intra-ISDN calls on remote cluster controller 2 (RCC2).

This feature uses two packages for remote switching center-SONET (RSC-S) enhanced ESA. For ISDN lines only, package NTXQ12AA (RSC enhanced ESA [lines only]) is required. For ISDN lines and trunks package NTXN82AB (RSC enhanced ESA [lines and trunks]) is required.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature supports RCC2 only.

This feature does not support features and hardware that are not supported by RCC2.

This feature does not support ISDN dual RCC2 warm ESA entry and exit.

Feature activation is not supported on calls surviving ESA warm entry and exit.

Generic services framework (GSF) calls are not supported over cold or warm entry, cold or warm exit, or during ESA.

For warm exit, dial tone is restored as soon as possible, usually within seconds. The actual dial tone delay depends on many factors, such as the call mix, occupancy of the CC RCC2 and host extended multiprocessor system (XMS)-based peripheral module (XPM) CPUs, or the distance of the RCC2 from the host XPM.

Feature interactions

This feature requires feature AF4894 (RCC2 ISDN Warm Entry/Exit - XPM) in order to function.

Feature AF4895 (Dual RCC2 Warm Entry/Exit for ISDN Calls) requires this feature in order to function.

Feature name

RCC2 ISDN Warm Entry/Exit - XPM

Description

This feature implements extended multiprocessor system (XMS)-based peripheral module (XPM) call processing changes for emergency stand-alone (ESA) warm entry for ISDN intraswitch calls. It also provides the ESA reports on the ISDN calls.

This feature uses two packages for remote switching center-SONET (RSC-S) enhanced ESA. For ISDN lines only, package NTXQ12AA (RSC enhanced ESA [lines only]) is required. For ISDN lines and trunks package NTXN82AB (RSC enhanced ESA [lines and trunks]) is required.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature supports RCC2 only.

This feature does not support features and hardware that are not supported by RCC2.

This feature does not support ISDN dual RCC2 warm ESA entry and exit.

Feature activation is not supported on calls surviving ESA warm entry and exit.

Generic services framework (GSF) calls are not supported over cold or warm entry, cold or warm exit, or during ESA.

For warm exit, dial tone is restored as soon as possible, usually within seconds. The actual dial tone delay depends on many factors, such as the call mix, occupancy of the CC RCC2 and host XPM CPUs, or the distance of the RCC2 from the host XPM.

Feature interactions

This feature requires feature AF4893 (RCC2 ISDN Warm Entry/Exit - CC) in order to function.

Feature AF4895 (Dual RCC2 Warm Entry/Exit for ISDN Calls) requires this feature in order to function.

AF4895

Feature name

Dual RCC2 Warm Entry/Exit for ISDN Calls

Description

This feature provides support for ISDN calls on dual remote cluster controller 2 (DRCC2) emergency stand-alone (ESA) warm entry and exit.

This feature uses two packages for remote switching center-SONET (RSC-S) enhanced ESA. For ISDN lines only, package NTXQ12AA (RSC enhanced ESA [lines only]) is required. For ISDN lines and trunks package NTXN82AB (RSC enhanced ESA [lines and trunks]) is required.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature supports single RCC2 and dual RCC2 only.

This feature does not support features and hardware that are not supported by RCC2.

Feature activation is not supported on calls surviving ESA warm entry and exit.

Generic services framework (GSF) calls are not supported over cold or warm entry, cold or warm exit, or during ESA.

For warm exit, dial tone is restored as soon as possible, usually within seconds. The actual dial tone delay depends on many factors, such as the call mix, occupancy of the CC RCC2 and host extended multiprocessor system (XMS)-based peripheral module (XPM) CPUs, or the distance of the RCC2 from the host XPM.

Feature interactions

This feature requires features AF4893 (RCC2 ISDN Warm Entry/Exit - CC) and AF4894 ((RCC2 ISDN Warm Entry/Exit - XPM) in order to function.

NTXS66AA

VPN SSP B (TA VPN)

This feature package supports the virtual private network on service control point II (SCPII).

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS66AA contents	
Feature number	Description
AJ2369	SCPII VPN Dial Plan Tables
AJ2860	VPN CALLP I
AJ2861	VPN SSP Messaging
AJ3280	VPN Callp II
AJ3285	DISA Calling DN Override

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTX106AA	IBN-Proprietary Business Set
NTX167AB	CCS7-Trunk Signaling
NTX270AA	New Peripheral Maintenance Package
NTX550AA	CCS7-Transaction Service Support
NTX941AA	CM Common
NTXA79AA	IBN Trunks with ISUP Signaling
NTXN18AA	FBUS-LIU Base
NTXN19AA	LIU7 for LPP Based CCS7 Applications
NTXR72AA	CCS7 MTP/SCCP for LPP Based Platforms
NTXS62AA	VPN SSP Base

AJ2369

Feature name

SCPII VPN Dial Plan Tables

Description

This feature provides the dial plan tables in the SSP that are required to support virtual private network (VPN) on service control point II (SCPII)

BCS history

This feature was created in BCS36.

Restrictions and limitations

Tables SITEDIAL, CITYWIDE, and SITELOC are restricted to a 256K size.

Feature interactions

This feature interacts with advanced intelligent network (AIN) features.

Datafill

Table	Description
SITEDIAL	New table for business group, site ID to dial plan mapping
SITELOC	New table for business group, site ID to location code mapping
BGIDCUST	New table for business group to customer group mapping
CITYWIDE	New table for business group to sets of site IDs mapping

AJ2860

Feature name

VPN Callp I

Description

This feature implements the changes required to support service control point (SCP) based virtual private network (VPN) on integrated business network (IBN) lines and market-specific trunks. This feature also provides call processing utilities for the VPN dial plan tables and base changes required for least cost routing (LCR) and PBX (authcode required) indicator.

BCS history

This feature was created in BCS36.

Restrictions and limitations

SCP based VPN does not support interaction with SSP based VPN.

This feature does not support LCR querying.

VPNTEST can only display those parameters that pass successfully through the parameter handler routines.

Datafill

Table	Description
TRIGGRP	VPN specific trigger detection points and triggers added

Office parameters are added to provide the capability of generating intrasite and intra-citywide billing calls.

Operational measurements

This feature will generate data for OM group VPN.

User interface

TRAVER is enhanced to display advanced intelligent network (AIN) information from the following tables:

- TRIGGRP
- TRIGINFO
- CUSTSTN
- TRKGRP
- BGIDCUST
- SITEDIAL
- SITELOC
- VPNMAP

- VPNXLA

TRAVER also displays any DIALPLAN trigger queries that are sent to the database, and any responses that are received from the database.

Automatic message accounting

The following new module code records terminating information

- Module Code 130 Termination attributes
- Table 338 Facility release cause
- Table 339 Call characteristic

The following new billing module and table provide for VPN billing:

- Module Code 508 Virtual Private Network billing details
- Table 340 Location value

Digit identifier table 78 has the following values added:

- 007 Originating private digits
- 008 terminating private digits
- 009 Alternate billing digits

Feature name

VPN SSP Messaging

Description

This feature introduces two new service switching point (SSP) based virtual private network (VPN) tables. These tables are required for VPN service control point (SCP) based translations

This feature also provides the required transaction capabilities application part (TCAP) utilities to allow VPN call processing to interact with the advanced intelligent network (AIN).

BCS history

This feature was created in BCS36.

Restrictions and limitations

Tables VPNMAP and VPNXLA are restricted to 256K size. The entries in tables VPNMAP and VPNXLA are ignored when ISDN translations are used and the call is not ONNET or LCR-ONNET.

A network class of service (NCOS) response value of zero, from the adjunct, does not alter the NCOS value associated with the incoming VPN agent.

The context specific parameter USERID is restricted to a 10 digit maximum.

The party selector value for parameter CallingPartyBGID is always equal to CALLING_PTY_NUM.

As part of the identification of VPN trigger information a valid global title transaction name and source must be specified.

Feature interactions

This feature requires the following tables in order to integrate VPN call processing into an AIN framework:

- AJ2369 SCPII VPN Dialplan Tables
- AJ2860 VPN Callp I

Datafill

Table	Description
VPNMAP	New table, for business group and site ID to VPN translation index mapping
VPNXLA	New table, for VPN translation index and NCOS to integrated business network (IBN) mapping

AJ3280

Feature name

VPN Callp II

Description

This feature updates virtual private network (VPN) billings by allowing terminating billing recording for trunks terminating on busy or congestion treatments.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The billing for termination attributes, field facility release cause, are only affected by VPN billable calls terminating on ANSI-ISDN user part (ANSI-ISUP), Australian ISDN user part (AISUP), and Australian telephone user part (ATUP).

Feature interactions

This feature interacts with the following SCP based VPN features:

- AJ2860 VPN Callp I
- AJ2861 VPN SSP Messaging

Datafill

Table	Description
AMAOPTS	Tuple RECORD TERMINATION added to record terminating information on trunk calls routed from the VPN feature, and encountering busy or no-circuit problems

Automatic message accounting

New values are added to table 338 of module code 130 to indicate the facility release cause.

Feature name

DISA Calling DN Override

Description

This feature is used to provide dial-on access for the virtual private network (VPN). It allows the direct inward systems access (DISA) directory number (DN) to overwrite the originator's calling party number, where the protocol is supported.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature supports line originations to the DISA port if the called number terminates on an Australian telephone user part (ATUP) trunk.

The VPN DN override option (VPNDNOVR) only functions if interworking is supported. If interworking is not supported, the values are not changes.

Datafill

Table	Description
DNROUTE	Refinement VPNDNOVR added to option DISA

NTXS67AA

DCR Multiple Network Access (MNA)

This feature package implements dynamically controlled routing for the multiple network access capability within the DMS switch.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS67AA contents	
Feature number	Description
AJ2885	DCR: MNA Activation

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
Either NTX022AB	Dynamically Controlled Routing (DCR/HPR)
or NTXP55AA	Dynamically Controlled Routing (DCR/LDR)

AJ2885

Feature name

DCR: MNA Activation

Description

This feature implements multiple network access (MNA) capability within the DMS system.

BCS history

This feature was created in BCS36.

Restrictions and limitations

If the DMS node is being accessed by a network processor and the priming sequence is in progress, the value of parameter NUM_DCR_NP_ACCESS cannot be changed from 1, or to 1.

The value of parameter NUM_DCR_NP_ACCESS can be lowered only to the number of networks datafilled in table DCRNETID.

Feature interactions

This activity is directly associated with features AJ2884 (DCR: MNA Table Control) and AJ2886 (DCR: Base RO Modifications), and requires both in order to function.

Datafill

Parameter NUM_DCR_NP_ACCESS is created in table OFCENG. The value of this parameter is in the range 1-6.

NTXS70AA

VPN SCP Base

This feature package implements market-specific Virtual Private Network (VPN) service on a service control point (SCP).

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS70AA contents	
Feature number	Description
AR0341	SCP-Telecom Australia VPN Service
AR0400	SCP - VNS Generic Query Processing
AR0401	SCP - VNS Generic Update Processing
AR0402	SCP - Virtual Network Service Generic OMs
AR0403	SCP - VNS Test Query (Tests)
AR0485	SCP AIN 0.1 TCAP Message Handler
AR0486	SCP TCAP to TCB Parameter Mapper
AR0630	SCP - VPN FSL Enhancements

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXQ54AB	SCP Application Framework

AR0341

Feature name

SCP - Telecom Australia VPN Service

Description

This feature implements the market-specific Virtual Private Network (VPN) service on a service control point (SCP), using the generic virtual network service (VNS) as a base.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The SCP does not provide operational measurements (OM) on a customer basis.

The SCP does not provide OMs on the received database update service orders.

This feature allows the SCP to support dial-on access by calling card account number (CCAN). However, this access type is not supported by the service switching point (SSP).

Feature interactions

This feature requires the following SCP II base features:

- AQ1092 SCP/SMS Audit Efficiency
- AR0326 TCB Dump Utility
- AR0327 FSL Service DB Creation and Access
- AR0400 SCP - VNS Generic Query Processing
- AR0401 SCP - VNS Generic Update Processing
- AR0402 SCP - Virtual Network Service Generic OMs
- AR0406 Additional FSL Building Blocks
- AR0577 SCP II Database Tools
- AR0704 SAF Phase II

This feature interacts with the following features in order to implement the VPN:

- AR0403 SCP - VNS Test Query (TESTSS)
- AR0485 SCP AIN 0.1 TCAP Message Handler
- AR0486 SCP TCAP to TCB Parameter Mapper
- AR0630 SCP - VPN FSL Enhancements

Operational measurements

The following two new OM groups are provided by this feature:

- VPN Query Traffic Counts (SCP wide)
- VPN Query Traffic Counts (by originating SSP)

Each of the above groups contains 11 registers.

AR0400

Feature name

SCP - VNS Generic Query Processing

Description

This feature provides generic query processing capabilities to support market specific virtual network services (VNS). Query processing involves receipt of decoded transaction capabilities application part (TCAP) messages, retrieving the appropriate subscriber record, passing the record to the application framework, instructing the server layer to formulate the appropriate TCAP response, and invoking operational measurements processing.

BCS history

This feature was created in BCS36.

Feature interactions

This feature is required by market-specific VNS query processing.

This feature is dependent upon the following features:

- AR0163 SCP Query Processing Application Framework
- AR0324 Transaction Control Block Manager
- AR0327 SCP VNS Database Create and Access
- AR0406 Additional FSL Building Blocks
- AR0485 SCP AIN 0.1 TCAP Message Handler
- AR0486 SCP TCAP to TCB Mapper

Feature name

SCP - VNS Generic Update Processing

Description

This feature provides the generic virtual network services (VNS) update processing capabilities. Update processing consists of the validation of data sent from the service management system (SMS), and in writing the data into the VNS database. A component of update processing also provides record retrieval capability, so that the SMS can audit or dump the VNS database.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature does not allow emergency deletions.

Feature interactions

This feature is dependent upon the following features:

- AR0164 SCP Update Processing Application Framework
- AR0334 ASN 0.1 Encode/Decode
- AR0336 SCP Database Create and Access

This feature also interacts with appropriate market-specific servicekit building block development features.

AR0402

Feature name

SCP - Virtual Network Service Generic OMs

Description

This feature provides the operational measurements (OM) for the virtual network service (VNS). These OMs are generic and are used by all market-specific variants of VNS.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature resides on the file processor series III peripheral of the DMS-SCP II product.

Restrictions and limitations

There is no OM pegging for VNS update processing.

OMs are not provided on a customer basis.

Feature interactions

This feature is invoked by feature AR0324 (Transaction Control Block Manager).

This feature interacts with the following features:

- AR0158 SCP II Service OM and Log Interface Enhancements
- AR0400 SCP - VNS Generic Query Processing

Operational measurements

The following two groups of VNS specific OMs are provided by the SCP with this feature:

- SAVFTQP VNS Query Traffic Counts (SCP wide)
- SAVFOQP VNS Query Traffic Counts (by originating SSP)

Each of the above groups consist of 11 registers that provide individual OMs information. The OMs are specified only for query processing.

Feature name

SCP - VNS Test Query (Tests)

Description

This feature provides a MAP (maintenance and administration position) command interpreter (CI) to allow a test query to be sent to a virtual network services (VNS) database, and to allow the response to be displayed at the MAP terminal. This facility is applicable to all market-specific VNS services.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature runs on the computing module of the service control point (SCP II).

Restrictions and limitations

This feature may result in the formation of queries that are not valid VNS queries (for example, they may have no parameters). They are, however, valid TCAP queries.

The maximum number of valid telephony digits sent in a query is 24, not 18, as supported by VNS. This increase permits testing of the advanced intelligent (AIN) network encode/decode feature.

Feature interactions

This feature interacts with feature AR0485 (SCP AIN 0.1 TCAP Message Handler).

User interface

One new MAP command, VPNSCP, is introduced with this feature. This command can be entered from any level of the MAP display, and provides access to command TestSS. TestSS allows the user to send valid queries to one or all instances of the SCP VNS application from the MAPCI level.

AR0485

Feature name

SCP AIN 0.1 TCAP Message Handler

Description

This feature provides message handling functions for service control point (SCP) advanced intelligent network (AIN) release 0.1 transaction capabilities application part (TCAP) query processing. The feature includes encoding and decoding of AIN 0.1 TCAP messages based on service-specific requirements and driving the AIN service-specific state machine for handling the exchange of an agreed message set between service switching points (SSP) and SCPs.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature implements a subset of the AIN 0.1 message set as described in Bellcore Technical Reference TR-NWT-001285, issue 1, August, 1992, *Advanced Intelligent Network (AIN) 0.1 Switch-Service Control Point (SCP) Application Protocol Interface Generic Requirements*.

In order to support virtual network services (VNS) for the first set of SCP applications, the description of the TCAP messages is augmented with 17 VNS private optional parameters. These parameters are not a part of the above-referenced specification.

This feature does not support conversation package types. As a result, no transaction ID management functions are implemented as part of this feature.

The TCAP AIN 0.1 message handler supports only single component TCAP packages.

Feature interactions

This feature defines a new entity in the SCP application framework (SAF), called the TCAP manager. All incoming and outgoing TCAP messages are processed by the TCAP manager and re-directed to the appropriate application service within the query processing function. This requires changes in the SAF event manager during execution of the process query event.

Feature name

SCP TCAP to TCB Mapper

Description

This feature provides the service control point (SCP) with the following capabilities:

- conversion of received transaction capabilities application part (TCAP) message parameters into internal transaction control block (TCB) message parameters
- conversion of TCB fields into outgoing TCAP message parameters
- allowing a service application to define the quantity and type of TCAP parameters and the equivalent TCB field attributes from an easily configurable data driven engineering file

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature will support only message parameters defined by Bellcore Technical Reference TR-NWT-001285, issue 1, August 1992, *Advanced Intelligent Network (AIN) 0.1 Switch-Service Control Point (SCP) Application Protocol Interface Generic Requirements*.

This feature will support only parameters defined by feature AR0341, SCP - Telecom Australia VPN services.

Feature interactions

This feature affects only service applications that use the AIN 0.1 message set.

AR0630

Feature name

SCP - VPN FSL Enhancements

Description

This feature enhances the service control point (SCP) application framework (AF) update processing (UP) software (SAF UP). It enables the service management system (SMS) to update or retrieve a subscriber record that contains a call aggregate building block (CallABB) with no dynamic parameters. The feature also adds the AnalyzeDialPlan building block (BB) to the BB library of the SAF layer.

BCS history

This feature was created in BCS36.

Feature interactions

This feature is built upon the SCP II base features.

NTXS71AA

TCAP/TCP Handler

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXS71AA contents	
Feature number	Description
AR0521	TCAP Over Ethernet

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTX550AA	CCS7 - Transaction Service Support
NTXF05AA	Ethernet Interface Unit
NTXF19AA	TCP/IP Protocols
NTXQ43AA	AIN R0.1 SSP
or NTXQ45AA	AIN Generic Messaging
NTXQ42AA	AIN Base
and NTXS71AA	TCAP/TCP Handler
NTXQ56AA	AIN REL 0.1 TCP/IP

AR0521

Feature name

TCAP Over Ethernet

Description

This feature provides an Interface to the Internet Transmission Control Protocol (TCP) which enables an Advanced Intelligent Network (AIN) Application to access services offered by an Application Service Provider (ASP) located on an Offboard Processor (OP) on an Ethernet Local Area Network (LAN). The AIN Application uses the services of the Signalling System Number 7 (SS7) Transaction Capability Application Part (TCAP) Application Protocol.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The following restrictions apply to this feature:

Only TCP/IP on Ethernet is supported. TCP/IP on IEEE 802.2 and IEEE 802.3 are not supported.

Only TCAP Issue-1 and TCAP Issue-2 specifications are supported. Other TCAP specifications (such as CCITT) are not supported.

The maximum TCAP message size is limited.

This feature uses the “keep-alive” signal provided by TCP/IP to monitor TCP connection sanity during idle periods. The TCP/IP software at the adjunct must respond to this periodic message.

The number of endpoint identifiers are a finite resource shared by all applications in a DMS office

To simplify maintenance, a CCS7 subsystem number is used in order to reuse existing SCCP Subsystem Management. SCCP Subsystem Management software limits the maximum number of AIN TCP connections in the CM to 32.

Only one TCP connection between an AIN Application and one ASP is supported by this feature but the implementation is done in such a way as to minimize the work required to support multiple TCP connections between multiple AIN applications and multiple ASPs should such flexibility be required in the future.

The current implementation of the TCP Handler does not support TCP urgent data.

All TCP connections are closed over all restarts or BCS software applications (restart swacts or norestart swacts).

Since Table Control is not used to datafill the remote socket, all connection configuration data is lost after any type of BCS upgrade.

WARNING - Because of this restriction, it is essential that all AINTCPMG subsystem instance are offlined and then deleted prior to performing a BCS application. Deletion must be performed using the AINTCPCI tool as described in the user interface section . If desired, the connection may be re-datafilled using AINTCPCI following the BCS application.

There are certain corruptions of the Package Type Identifier byte and/or Total TCAP Message Length byte (s) which are handled by this feature in a non-compliant manner.

CC Software Support for EDRAM Uploading

This feature package provides central control software for the enhanced digital recorded announcement machine (EDRAM) to implement the following functionality:

- conversion of announcement-file formats to binary format
- provision of a means for maintenance personnel to query announcement file names in EDRAM
- uploading of EDRAM announcement files to an external storage device on a DMS switch

This feature package applies to DMS-100 offices.

Feature package contents

Feature number	Description
AQ0984	CC Support for EDRAM Uploading

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXN16AA	Enhanced DRAM

AQ0984

Feature name

CC Support for EDRAM Uploading

Description

This feature implements the following functionality for the enhanced digital recorded announcement machine (EDRAM):

- uploading of EDRAM announcement files to an external storage device on a DMS switch
- providing a means for maintenance personnel to query announcement file names in EDRAM
- enhancement of the loader to support the EDRAM announcement files in a new binary format

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires that at least one digital trunk module be installed on the switch.

Restrictions and limitations

This feature works only with single-density announcement files.

Uploaded announcement files are in a new binary format. They can only be used on a switch where this feature is active.

The uploading part of this feature supports only three external storage devices: SFDEV, disk, or tape.

Feature interactions

This feature is built upon feature AL1696 (CC Software Support for Enhanced DRAM), and requires this feature in order to function.

The digital trunk module firmware is modified to support uploading and name query. The correct firmware for this feature is EDRAM.AC01 or higher revision.

User interface

This feature creates a new command, UPLOAD. This command is activated on the DTM level of the MAP (maintenance and administration position) to upload files from the EDRAM to a specified storage device.

Command QUERYPM, on the DTM level of the MAP, is enhanced to display the names of the files in EDRAM.

NTXS74AA

C7TUNIT

This feature package applies to DMS-100 offices with CCS7.

Feature package contents

Feature package NTXS74AA contents	
Feature number	Description
AR0628	Productization of FORCENI Tool

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXR72AA	CCS7 MTP/SCCP for LPP Based Platforms

AR0628

Feature name

Productization of FORCENI Tool

Description

The purpose of this feature is to associate an incoming CCS7 message with a network and a protocol on the basis of the link on which the message arrives, regardless of the network indicator (NI) sent in the message. It accomplishes this by permanently modifying the NI (located in the service information octet (SIO) of the message transfer part (MTP) of the incoming CCS7 message).

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature is active on an office basis and cannot be disabled.

The NI in the SIO is permanently overwritten for all incoming messages, although datafill can be engineered such that the NI is overwritten with its original value.

NTXT10AA

Billing Server Poller Access Manager

This feature package provides support for the AMA teleprocessing system (AMATPS) and XFER protocols as part of the implementation of a hybrid billing server (HBS).

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXT10AA contents	
Feature number	Description
AD6516	Poller Access Manager-Phase 1

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXP94AA	FTFS Disk Shadowing

AD6516

Feature name

Poller Access Manager - Phase I

Description

This feature provides support for the automatic message accounting (AMA) teleprocessing system (AMATPS) and XFER protocols as part of the implementation of a hybrid billing server (HBS).

BCS history

This feature was created in BCS36.

Hardware requirements

Implementation of AMATPS in the HBS system requires the standard distributed processing peripheral hardware configuration.

Restrictions and limitations

The DPP data spooler and XFER data poller are mutually exclusive.

The DPP can interpret only AMA Bellcore compliant data.

User interface

This feature creates a new command interpreter directory, HBSXFER. This directory is available from any MAP (maintenance and administration position) level.

WLC - Line Administration Phase II

This feature package provides a new off-hook balance test (OHBT) procedure. The test is used by call processing on individual lines to optimize the balance network for loaded subscriber loops. In addition, the test determines the attenuation pad values necessary for the subscriber's line to meet the transhybrid loss requirements.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXT11AA contents	
Feature number	Description
AR0900	37-0109 Line Admin PII (CC Part)

BCS history

This feature package was created in BCS36.

AR0900

Feature name

37-0109 Line Admin PII (CC Part)

Description

This feature provides a new off-hook balance test (OHBT) procedure. The test is used by call processing on individual lines to optimize the balance network for loaded subscriber loops. In addition, the test determines the attenuation pad values necessary for the subscriber's line to meet the transhybrid loss requirements.

The OHBT introduced by this feature is enabled or disabled for a complete office by datafillable parameters in table OHBTADMN. Table OHBTINV is datafilled to enable or disable OHBT for individual lines.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature uses the dedicated resources of an NT4X23AA digital test unit (DTU) with downloadable firmware specific to this application.

Restrictions and limitations

For any given line, the automatic balance selection off-hook test can only be run if this feature is disabled for that line.

Testing is supported for line-to-line, trunk-to-line and line-to-trunk calls only. OHBT will be invoked only when both parties on the call are either standard lines or standard trunks.

All OHBT testing is disabled while an image dump is in progress.

When the originating and terminating parties on a call have the same line equipment number, no test will be performed on either party.

OHBT will not be attempted on lines datafilled as WL902B with ground start.

If an OHBT test is scheduled for either party of a call that would normally be intraswitched, the intraswitching is blocked for that call.

If both parties in a call are scheduled for OHBT test, then the originating party takes precedence.

Originating tests on lines connected to Northern Telecom channel banks will fail, as channel banks use tones while setting up the call. These tones conflict with the test tones.

The terminating OHBT requires an answer message to invoke the feature.

Maintenance Trunk Modules or TM8 peripheral modules do not support some of the supervision required by the OHBT. An OHBT is not performed on calls using these peripheral devices.

An OHBT is stopped as soon as a flash message is received.

After an OHBT has been attempted on a call, reanswer is not supported for that call.

Feature interactions

This feature replaces feature NC0495 (Off-hook Testing).

This feature interacts with feature AE1298 (World Line Card 40 mA).

The following feature packages are required if $900\ \Omega + 2.16\ \mu\text{F}$ balance networks are to be used with World Line Cards:

- NTXW20AA North American $900\ \Omega + 2.16\ \mu\text{F}$ Template (Type A WLC)
- NTXW21AA North American $900\ \Omega + 2.16\ \mu\text{F}$ Template (Type B WLC)

Datafill

Table	Description
OHBTADMN	New table, used to set office administration parameters
OHBTINV	New table, used to set up balance test information for each line

Operational measurements

This feature introduces DTU peg counts and usage counts to enable the operating company to carry out the following operations:

- monitor the traffic pattern
- monitor the number of DTUs required to support this feature
- count the number of tests that failed to complete due to lack of DTU resource

Logs

The following logs are generated by this feature:

- LINE 300 DTU failed maintenance tests

- LINE 301 Result handling process failed to update the balance network configuration after testing
- LINE 600 Test Completed successfully. OHBT recommends the same balance network as that datafilled before the test.
- LINE 601 Test Completed successfully. OHBT recommends a different balance network from that datafilled before the test.
- LINE 602 Test failed to complete
- LINE 603 Feature is enabled or disabled.

User interface

This feature introduces the following communications interface commands:

- SCHDOHBT Schedule Lines for OHBT. Allows a series of lines within one peripheral module to be scheduled for OHBT, or for all supported lines within the office to be scheduled with a single command.
- QOHBT Query OHBT Information for Lines. Provides detailed information on lines involved in OHBT.
- QDTU Query Digital Test Units. Provides information on DTUs datafilled for OHBT, and provides a mechanism for forcing DTU maintenance to run.

Spontaneous Call Waiting ID (SCWID)

This feature package brings CLASS: Spontaneous Call Waiting Identification into compliance with the following Bellcore Technical Requirements:

- TR-NWT-000575, *CLASS Feature: Calling Identity on Call Waiting (CIDCW)*, issue 1, October, 1992
- TR-NWT-000030, *Voiceband Data Transmission Interface Generic Requirements*, issue 2 October, 1992

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXT12AA contents	
Feature number	Description
AN0616	SCWID TR Compliancy - CC
AN0631	SCWID TR Compliancy - XPM

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXN97AA	Call Waiting Display

AN0616

Feature name

SCWID TR Compliancy - CC

Description

This feature modifies the operation of feature AG2073 (CLASS: Spontaneous Call Waiting Identification) to bring it into compliance with the following Bellcore Technical Requirements:

- TR-NWT-000575, *CLASS Feature: Calling Identity on Call Waiting (CIDCW)*, issue 1, October, 1992
- TR-NWT-000030, *Voiceband Data Transmission Interface Generic Requirements*, issue 2 October, 1992

This feature covers modifications to the central control only.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of an NT6X78AB (CLASS modem resource) card for the transmission of display information to the customer premises equipment (CPE).

Spontaneous Call Waiting Identification (SCWID) compatible CPE must be installed.

This feature also requires the provision of a new NT6X69AD (tones and messaging) card to support the analog display services interface tones.

Restrictions and limitations

The following peripheral equipment must be based upon the unified processor (UP) in order to support SCWID:

- line group controllers (LGC)
- line trunk controllers (LTC)
- Remote Cluster Controller (RCC)
- Subscriber Module SLC-96 (SMS)
- Subscriber Module Urban - ISDN (SMU-ISDN)

Feature interactions

This feature interacts with feature AN0323 (CLASS: Calling Name TR Compliancy - Residential) to allow for transaction capabilities application part (TCAP) name delivery to a SCWID subscriber.

This feature modifies the interaction of the proprietary SCWID feature for the following subscriber features:

- Call Forwarding on Call Waiting
- Distinctive Call Waiting Tones
- Three-way Calling

Datafill

Table	Description
RESOFC	Field ACK_TONE removed
RESOFC	Field DATETIME added for the SCWID tuple

Service orders

Any attempt to add SCWID to a line extended from an LGC, LTC, RCC, RCC2, SMS, SMU-ISDN, or subscriber carrier module-100 access (SMA) that is not UP based will be denied and an error message returned.

If Call Waiting (CWT) is not present on a line when SCWID is added, it will be added automatically. Likewise, when SCWID is removed, CWT will automatically be removed.

Feature name

SCWID TR Compliancy - XPM

Description

This feature modifies the operation of feature AG2073 (CLASS: Spontaneous Call Waiting Identification) to bring it into compliance with the following Bellcore Technical Requirements:

- TR-NWT-000575, *CLASS Feature: Calling Identity on Call Waiting (CIDCW)*, issue 1, October, 1992
- TR-NWT-000030, *Voiceband Data Transmission Interface Generic Requirements*, issue 2, October, 1992

This feature covers modifications to the XMS-based peripheral module (XPM) only.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of an NT6X78AB (CLASS modem resource) card (CMR) for the transmission of display information to the customer premises equipment (CPE).

Spontaneous Call Waiting Identification (SCWID) compatible CPE must be installed.

This feature also requires the provision of a new NT6X69AD (tones and messaging) card to support the analog display services interface tones.

Restrictions and limitations

If the XPM does not have universal tone receivers (UTR) datafilled, the normal call waiting tone will be applied to the line.

If the CMR and UTRs are datafilled, but no UTR channels are available, the line will receive normal call waiting tone and no display data.

During the data transmission period, the original talk path is left in a silent state. If the silent state is maintained for 1 s without completion of data transmission, the data transmission is terminated and the talk path is re-established.

Any established call with a feature function block attached will not survive a warm activity switch (SWACT) of the XPM. If the XPM undergoes a warm SWACT between the alert and re-alert sequence before the incoming call is acknowledged, all parties of the SCWID call will drop.

Feature interactions

This feature interacts with feature AN0323 (CLASS: Calling Name TR Compliancy - Residential) to allow for transaction capabilities application part (TCAP) name delivery to a SCWID subscriber.

This feature modifies the interaction of the proprietary SCWID feature for the following subscriber features:

- Call Forwarding on Call Waiting
- Distinctive Call Waiting Tones
- Three Way Calling

NTXT13AA

Analog Display Service Interface

This feature package modifies the Analog Display Services Interface (ADSI) to ensure that it complies with Bellcore Technical Reference TR-NWT-001273, *Generic Requirements for an SPCS to Customer Premises Equipment Data Interface for Analog Display Services*, issue 1, December, 1992.

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXT13AA contents	
Feature number	Description

or	
NTXP95AA	ADSI Visual Screen List Editing
or	
NTXP96AA	ADSI Call Logging

AN0632

Feature name

ADSI Compliancy - CC

Description

This feature modifies the central control (CC) part of the existing proprietary Analog Display Services Interface (ADSI) to ensure that it complies with Bellcore Technical Reference TR-NWT-001273, *Generic Requirements for an SPCS to Customer Premises Equipment Data Interface for Analog Display Services*, issue 1, December, 1992.

This feature also modifies existing applications that use ADSI.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of an NT6X78AA (CLASS modem resource) card (CMR) for the transmission of softkey and display information to the customer premises equipment (CPE).

This feature also requires the provision of a new NT6X69AD (tones and messaging) card to support the ADSI tones.

Restrictions and limitations

ADSI is limited by the throughput of the CMR card. Only 10 ADSI application sessions can be active in a CMR card at one time.

TCAP Name is not supported for Call Log.

Feature interactions

This feature modifies the operation of the following features:

- AF2993 Visual Screen List Editing
- AN0082 Call Logging
- NC0377 SCWID with Disposition

Datafill

Table	Description
LTCINV	Tone set NORTHAA added
OPTCTL	Tuple added to control the assignment of ADSI to subscriber lines
-continued-	

Table	Description
RESFEAT	Line option ADSI added
RESOFC	Tuple ADSI added
SOFTKEY	Field LLABEL increased from 7 to 18 characters Field SLABEL increased from 4 to 7 characters Field RETURN changed from 14 characters to 14 bytes
TEXTLOG	Field DEFNLIST increased to a maximum of 8 definer numbers Fields MODE and SKT added to vector DEFNLIST
TEXTPHRS	Field LRCI added Vector HLMODE added
End	

Service orders

This feature adds option ADSI to the RES and IBN line class code (LCC).

AN0633

Feature name

ADSI Compliancy - XPM

Description

This feature modifies the extended multiprocessor system (XMS) based peripheral module (XPM) part of the existing proprietary Analog Display Services Interface (ADSI) to ensure that it complies with Bellcore Technical Reference TR-NWT-001273, *Generic Requirements for an SPCS to Customer Premises Equipment Data Interface for Analog Display Services*, issue 1, December, 1992.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature requires the provision of an NT6X78AA (CLASS modem resource) card (CMR) for the transmission of softkey and display information to the customer premises equipment (CPE).

This feature also requires the provision of a new NT6X69AD (tones and messaging) card to support the ADSI tones.

A successful ADSI session requires ADSI compatible CPE.

Restrictions and limitations

ADSI is limited by the throughput of the CMR card. Only 10 ADSI application sessions can be active in a CMR card at one time.

TCAP Name is not supported for Call Log.

Feature interactions

This feature requires feature AN0632 (ADSI Compliancy - CC) to provide the central control component of the ADSI enhancement.

This feature modifies the operation of the following features:

- AF2993 Visual Screen List Editing
- AN0082 Call Logging
- NC0377 SCWID with Disposition

Tailored Centrex - Power User Tools

This feature package simplifies the installation procedures for Meridian Business Sets (MBS), with display, that support power features. The user can verify the line equipment number (LEN) of a set, and use the power features to assign the set's feature keys.

This feature package applies to DMS-100 offices.

Feature name

Power Features Installer Application

Description

This feature simplifies the installation procedures for Meridian Business Sets (MBS), with display, that support power features. The user can verify the line equipment number (LEN) of a set, and use the power features to assign the set's feature keys.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The user application can be invoked only from an idle directory number key, using code access.

This feature can be used only on terminals or sets that support power features.

The Query LEN feature is not a set-assignable feature, and cannot be added to a key.

The station ringer test that is invoked through the installer menu does not implement the run integrity test (RIT).

Feature interactions

This feature requires the following feature packages in order to provide the required functions:

- NTX056AA Enhanced Administration. Supports the journal files
- NTXF88AA MBS Interactive Displays. Supports the power features.
- NTXR44AA Power Feature Audit Trail. Supports the audit log.

Datafill

AN0739

Feature name

SMDR for PVN

Description

This feature enhances station message detail recording (SMDR) for calls accessing a private virtual network (PVN). The data returned from the service control point (SCP) is recorded in a new SMDR extension record.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature applies only to advanced intelligent network (AIN) version 0.0.

This feature will not function in an SL100 switch for which the SMDRLNK pool is used. SMDRLNK and the DF03 extension records created by this feature are incompatible.

SMDR is not started as a result of the translations following an SCP response message.

Normal SMDR activation applies to PVN calls

Feature interactions

This feature requires the following features in order to function correctly:

- AG0829 Private Virtual Networking Deliverable
- AG2243 Directory Number Trigger for Intelligent Networking

Datafill

Table	Description
CUSTSMDR	Option PVN added

Automatic message accounting

This feature introduces an extension record specifically for SMDR PVN calls. The extension record has a record code DF and a format code 03. The information for extension record DF03 is derived from existing parameters retrieved from the SCP response message.

Feature name

Carrier Code Expansion for LEAS

Description

This feature provides the required changes to support feature group D (FGD) carrier identification code (CIC) expansion for local access and transport area (LATA) equal access system (LEAS) calls, using multi frequency and signaling system number 7 (SS7) signaling.

This feature also includes CIC expansion changes for equal access intermediate tandem (EAIT).

BCS history

This feature was created in BCS36.

Restrictions and limitations

Due to the size of the digit register, the maximum number of digits for a LEAS call is 24. Expanding the number of carrier access code (CAC) digits by two, from 5 to 7, reduces the maximum number of called digits by two.

Feature interactions

This feature interacts with the following features:

- AN0834 TOPS Equal Access: FGD CIC Expansion
- AN0883 TOPS Equal Access: FGD CIC Expansion - Signaling

Datafill

This feature introduces the following new office parameter:

- LEAS_FOUR_DIGIT_CIC_STATUS

This parameter is added to table OFCENG, and is initialized to value THREEDIG.

NTXT19AA

TOPS EA: FGD CIC Expansion

This feature package provides the required changes and restructuring in key functions, screen displays, automatic message accounting (AMA), and operational measurements (OM) to support feature group D (FGD) carrier identification code (CIC) expansion for TOPS calls to accept and process four-digit CICs.

This feature package applies to DMS-100 offices.

Feature name

TOPS Equal Access: FGD CIC Expansion

Description

This feature, in conjunction with feature AN0883 (TOPS Equal Access: FGD CIC Expansion Signaling), provides the changes necessary to support feature group D (FGD) carrier identification code (CIC) expansion for TOPS calls to accept and process four-digit CICs. This feature provides the required changes and restructuring in key functions, screen displays, automatic message accounting (AMA), and operational measurements (OM).

BCS history

This feature was created in BCS36.

Restrictions and limitations

In an operator centralization environment this feature will only work when all the hosts and remote units are upgraded to TOPS02.1 or higher.

Offices with open position protocol positions must be upgraded with a load compatible with this feature before this feature can be activated.

Offices with TOPS position controllers (integrated or stand alone) must be upgraded with a load compatible with this feature before this feature can be activated.

Feature interactions

This feature is coupled with feature AN0883 (TOPS Equal Access: FGD CIC Expansion Signaling) to provide the necessary CIC expansion.

Datafill

Table	Description
TOPEACAR	Fields CARDIGS and ALTCARR expanded from three digits to four digits

Operational measurements

The registers in the existing OM group TOPSEA are updated to accommodate four digit CICs.

User interface

This feature updates KP IC on TOPS 4 and IC on TOPS MP to allow four digit input.

This feature also updates the display for the CIC field after IC message to allow it to display four digit CICs

Automatic message accounting

Table 57 is upgraded to record four digit CICs for FGD.

NTXT20AA

NFA AMA

This feature package modifies the network facility access (NFA) automatic message accounting (AMA) generation procedures to incorporate the new definition for the access type field.

This feature package applies to DMS-100 offices.

AN0435

Feature name

NFA: AMA Modifications

Description

This feature modifies the network facility access (NFA) automatic message accounting (AMA) generation procedures to incorporate the new definition for the access type field. It also alters the use of the CONV_REQ field of AMA module record 047. This module is appended to AMA records that are generated to record an NFA trunk connection, as well as AMA records that are generated to record calls that are extended by an NFA trunk connection.

BCS history

This feature was created in BCS36.

Datafill

The provisioning rules for Office Parameter CRS_SUBRU_POOL2_SIZE are modified to eliminate all scenarios where two 047 modules are attached to an NFA AMA record. This feature removes any situation where this could occur.

Automatic message accounting

This feature redefines the access method field of AMA module 047. The access field now indicates the type of NFA connection that took place prior to the event that is recorded in the corresponding AMA record.

NTXT22AA

CC Support for ISM Part 2

This feature package enhances the maintenance and diagnostic functions of the trunk module/ maintenance trunk module (TM/MTM), and enhances the slot verification procedure to include the ISM shelf in the verification task.

This feature package applies to DMS-100 offices.

AR0918

Feature name

CC Support for the Integrated Service Module (ISM)

Description

This feature completes the functionality required to incorporate the ISM into the DMS system. It enhances the maintenance and diagnostic functions of the trunk module/ maintenance trunk module (TM/MTM) as required, and enhances the slot verification procedure to include the ISM shelf in the verification task.

In addition to the above, this feature adds a new display function to provide information concerning the circuits resident on the ISM shelf.

BCS history

This feature was created in BCS36.

Hardware requirements

This feature supports the following hardware:

- NTFX42AA ISM controller card
- NTFX4101 ISM shelf assembly
- NTFX43AA ISM DC converter

Feature interactions

This feature requires the provision of preparatory feature AQ0972 (CC Support for the ISM)

User interface

This feature adds command TRNSL P to the POST TM/MTM level of the maintenance and administration position (MAP).. This command results in a display of information concerning the cards and circuits based on the ISM shelf.

NTXT23AA

TR-303 Generic Interface

This feature package provides the DMS-100 TR303 MultiVendor Interface (MVI).

This feature package applies to DMS-100 offices.

Feature package contents

Feature package NTXT23AA contents	
Feature number	Description
AF4879	MVI Lines Provisioning Enhancements
AF4882	MVI Protocol Stack Application Layer
AF4883	MVI Convergence Function I
AF4887	MVI Protocol Stack Application Layer II
AF5378	MVI CM Path Protection Switching
AF5455	MVI Per Line Ringing - CM
AF5533	TR-303 MVI Object Model
AF5536	MVI Line Testing - CM
AF5537	MVI Line Provisioning - CM

BCS history

This feature package was created in BCS36.

Required feature packages

Required feature packages	
Feature package number	Description
NTXF46AA	Subscriber Carrier Module-100 Access

AF4879

Feature name

MVI Lines Provisioning Enhancements

Description

This feature enhances feature AF2614, RFT Line Provisioning, to datafill the locally switched single party subscriber lines of the remote digital terminal (RDT) for the DMS-100 TR303 multivendor interface (MVI). This feature also handles the incoming message overload faults (babble) for the MVI RDT lines.

BCS history

This feature was created in BCS36.

Restrictions and limitations

This feature supports only those RDT lines with locally switched single party services. Multi-party and direct inward dialing services are not supported by this feature.

Feature interactions

This feature requires the following features in order to function correctly:

- AF2614 RFT Line Provisioning
- AF3801 SMA Dynamic Service Option Update II
- AF4438 RFT Line Provisioning Extensions
- AF4880 MVI Call Processing I
- AF4882 MVI Protocol Stack Application Layer I
- AF4883 MVI Convergence Function I
- AF4884 MVI Convergence Function II
- AF4887 MVI Protocol Stack Application Layer II
- AF5444 MVI Call Processing Line Data - CM
- AF5445 MVI Call Processing Line Data - SMA
- AF5455 MVI Per Line Ringing - CM
- AF5456 MVI Per Line Ringing - SMA
- AF5533 MVI Object Module II

Datafill

Table	Description
RDTINV	Subfields INHLINE and MAXLINES added to variant RDT, types GENCSC and GENTMC
RDTINV	Field SHELFSLT moved to variant RDT, type RFT only
RDTLT	Subfields ds1_lt and ds0_ct added to field qds0info

AF4882

Feature name

MVI Protocol Stack Application Layer

Description

This feature is one of a group of features that allow the DMS-100 switch to provide the necessary interfaces and services for access vehicles conforming to Bellcore Technical Requirements TR-TSY-000303, issue 1, March, 1990, *Integrated Digital Loop Carrier System Generic Requirements, Objectives and Interface* for integrated digital loop carrier (IDLC) systems. This group of features is known as the DMS-100 TR303 MultiVendor Interface (MVI).

This feature provides the following functions to support the TR303 MultiVendor Interface (MVI):

- Mechanisms to allow applications to access and utilize the services of the MVI protocol stack
- Services and protocol support for common management information service element (CMISE) messages
- Abstract Syntax Notation 1 (ASN.1) basic encoding rules (BER) translation invocation

BCS history

This feature was created in BCS36.

Restrictions and limitations

Application protocol data unit message size must not exceed 2 000 octets when encoded in the BER transfer syntax. This limit is imposed by the convergence function.

Object references must exist in the MVI object model.

Due to the operation of the convergence function as defined by Bellcore Technical Requirements TR-TSY-000303, and the possibility of path protection switches, the MVI protocol stack cannot guarantee error free CMISE message delivery.

Feature interactions

This feature requires the following features in order to function correctly:

- AF4877 MVI Path Protection Switching
- AF5533 TR-303 MVI Object Model
- AG1608 FLC Base Messaging

The following features use this feature to transport and receive CMISE messages:

- AF5536 MVI Line Testing - CM
- AF4879 MVI Lines Provisioning Enhancement
- AF4881 MVI LDS Applications I

AF4883

Feature name

MVI Convergence Function I

Description

This feature is one of a group of features that allow the DMS-100 switch to provide the necessary interfaces and services for access vehicles conforming to Bellcore Technical Requirements TR-TSY-000303, issue 1, March, 1990, *Integrated Digital Loop Carrier System Generic Requirements, Objectives and Interface* for integrated digital loop carrier (IDLC) systems. This group of features is known as the DMS-100 TR303 MultiVendor Interface (MVI).

The embedded operations channel (EOC) represents an input/output interface for DMS MVI applications that communicate with a remote digital terminal (RDT). This feature provides elements of the EOC relating to the convergence function (CF). CF performs segmentation and reassembly of application messages as its main function.

BCS history

This feature was created in BCS36.

Restrictions and limitations

TR-303 compliance is based upon Northern Telecom Implementation Specification NIS A217-2, issue 01.01, October, 1993.

Feature interactions

This feature cannot function without the provision of the following features:

- AF4882 MVI Protocol Stack Application Layer
- AF4887 MVI Protocol Stack Application Layer II
- AF5533 TR-303 MVI Object Model

This feature is designed to operate in conjunction with feature AF4884 (TR-303 Convergence Function XPM). Feature AF4884 is an extended peripheral module (XPM) feature.

Feature name

MVI Protocol Stack Application Layer II

Description

This feature is one of a group of features that allow the DMS-100 switch to provide the necessary interfaces and services for access vehicles conforming to Bellcore Technical Requirements TR-TSY-000303, issue 1, March, 1990, *Integrated Digital Loop Carrier System Generic Requirements, Objectives and Interface* for integrated digital loop carrier (IDLC) systems. This group of features is known as the DMS-100 TR303 MultiVendor Interface (MVI).

This feature provides the following parts of the TR-303 stack:

- Communications control
- Initialization and recovery control
- Remote operations service element (ROSE) messaging

BCS history

This feature was created in BCS36.

Feature interactions

This feature is dependent upon feature AF4882 (MVI Protocol Stack Application Layer) to provide gates for association state change notification.

This feature also depends upon features AF4883 (MVI Convergence function I) and AF4884 (MVI Convergence function II). These features provide presentation layer services that are needed by the ROSE messaging part of this feature.

AF5378

Feature name

MVI CM Path Protection Switching

Description

This feature is one of a group of features that allow the DMS-100 switch to provide the necessary interfaces and services for access vehicles conforming to Bellcore Technical Requirements TR-TSY-000303, issue 1, March, 1990, *Integrated Digital Loop Carrier System Generic Requirements, Objectives and Interface* for integrated digital loop carrier (IDLC) systems. This group of features is known as the DMS-100 TR303 MultiVendor Interface (MVI).

Path protection switching (PPS) is a recovery mechanism for the IDLC communication channels. PPS maintains active and standby message paths for the embedded operations channel and the time-slot message channel, and provides path switching upon automatic fault detection or when initiated by maintenance personnel.

BCS history

This feature was created in BCS36.

Restrictions and limitations

Application messages may be lost during a path switch.

Recovery from double faults, such as loss of both active and standby, is not possible.

Datafill

Table	Description
RD TinV	Field RDTPPLNK added to identify the path protection facility configured by the remote digital terminal

Feature name

MVI Per Line Ringing - CM

Description

This feature is one of a group of features that allow the DMS-100 switch to provide the necessary interfaces and services for access vehicles conforming to Bellcore Technical Requirements TR-TSY-000303, issue 1, March, 1990, *Integrated Digital Loop Carrier System Generic Requirements, Objectives and Interface* for integrated digital loop carrier (IDLC) systems. This group of features is known as the DMS-100 TR303 MultiVendor Interface (MVI).

This feature provides the necessary software in the local digital switch (LDS) to allow coded or superimposed ringing on individual lines connected to remote digital terminals that use hybrid signaling as defined in the above-referenced Bellcore document.

BCS history

This feature was created in BCS36.

Feature interactions

Feature AF5456, MVI Per Line Ringing - SMA, complements this feature by providing the individual line ringing function at the subscriber carrier module - 100 access.

Datafill

Table	Description
RDTINV	Field RNGDATA removed
LNINV	Values RDTC and RDTS added to field CARDINFO

AF5533

Feature name

TR-303 MVI Object Model

Description

This feature provides an object model for use in subscriber carrier module-100 access (SMA) multivendor applications, in accordance with Bellcore Technical Requirements TR-TSY-000303, issue 1, March, 1990, supplement 3, *Integrated Digital Loop Carrier System Generic Requirements, Objectives and Interface: Operations (ROS/CMIS/ASN.1) Messages Release 1.0*. This feature also provides access to the ASN.1 object model through the Cristal toolset.

BCS history

This feature was created in BCS36.

Restrictions and limitations

The DMS family switch must be able to communicate simultaneously with the multivendor and the FiberWorld Product (FWP) network elements. It is a requirement, therefore, that the object model created by this element can co-exist with the FWP object model.

Feature interactions

This feature is used by all features that generate SMA multivendor interface applications requiring the object model.

Feature name

MVI Line Testing - CM

Description

This feature provides the necessary computing module software to perform maintenance on remote digital terminal (RDT) POTS, coin, ISDN, and multiparty line types from the line test position (LTP), or remotely using the no test trunk (NTT).

BCS history

This feature was created in BCS36.

Feature interactions

This feature interacts directly with feature AF5354, Line Testing - SMA.

AF5537

Feature name

MVI Line Provisioning - CM

Description

This feature is one of a group of features that allow the DMS-100 switch to provide the necessary interfaces and services for access vehicles conforming to Bellcore Technical Requirements TR-TSY-000303, issue 1, March, 1990, *Integrated Digital Loop Carrier System Generic Requirements, Objectives and Interface* for integrated digital loop carrier (IDLC) systems. This group of features is known as the DMS-100 TR303 MultiVendor Interface (MVI).

This feature implements multiparty provisioning for the TR303 MVI. In addition it implements datafill restrictions and updates the provisioning of link access procedure D-channel (LAPD) parameters.

BCS history

This feature was created in BCS36.

Feature interactions

This feature requires the following features:

- AF1957 RDT Table Control
- AF2530 RDT Line Table Control II
- AF2614 RFT Line Provisioning
- AF3801 SMA Dynamic Service Option Update II
- AF4438 RFT Line Provisioning Extensions
- AF4870 Enhanced Flow Through Provisioning I
- AF4879 MVI Lines Provisioning Enhancements
- AF4882 MVI Protocol Stack A

Datafill

Table	Description
RDTINV	Values for subfields ELAPDPAR and CLAPDPAR updated

Service orders

The GND option is now compatible with line class codes of 2FR (for two-party lines) and 4FR (for four-party lines).
